You're traveling through 140° terrain at 300 rpm.

Only one disk guarantees safe passage through the torrid zone of drive heat. Maxell.

A lifetime warranty. And manufacturing standards that make it almost unnecessary.

Consider this: Every time you take your disk for a little spin, you expose it to drive heat that can sidetrack data. Worse, take it to the point of no return. Maxell's unique jacket construction defies heat of 140°F. And keeps your information on track.

And Maxell runs clean. A unique process impregnates lubricants throughout the oxide layer. Extending media and head life. How good is Gold?

Maxell's the disk that many drive manufacturers trust to put new equipment through its paces. It's that bug-free.

So you can drive a bargain. But in accelerated tests, Maxell floppys lead the industry in error-free performance and durability. Proving that if you can't stand the heat you don't stand a chance.

maxell
IT'S WORTH IT.

THE 22-SECOND DEMONSTRATION OF DESKTOP PERFORMANCE

MT180L (132 columns)

PRICE REDUCTION!

In the computerized business of the eighties, more decisions will hinge on getting the right information in the right hands at the right moment. How well you do that will ultimately depend on the performance and durability of your printer.

**SMARTER,
FASTER,
STRONGER.**

In the Tally MT160/180 series, a powerful 16-bit microprocessor master-minds document flow. That means saving valuable seconds when seeking the shortest possible print path. And printing at top speed all day long. Some machines claim 160 cps but can't hold that speed because they're not engineered or built like a Tally.

You can quickly run down the extensive menu of print styles and word processing enhancements, making selections at a touch. On L models, switch from draft mode to letter quality just as easily and get results the *Creative Computing* magazine calls "superb."

All 160/180 models have adjustable tractors and friction feed paper handling. And both parallel and serial interface ports are built in. So you're ready to print right out of the box.

The spreadsheet you see above was produced in a scant 22 seconds. In an age when every moment counts, that's desktop performance at its best.

For more information, and a dealer in your area contact: Mannesman Tally Corporation, 703 Petrolia Rd., Downsview, Ontario M3J 2N6 416-661-9783
Telex: 06 522 873

The **BEST** News All Day

The **BEST** personal computer is your best opportunity to own a really powerful, flexible personal computer at a really attractive price.

For less than the cost of other comparable systems, the **BEST** offers you a sixteen bit 8088 based computer compatible with most MS-DOS based software.

The basic **BEST**

- 64K of RAM expandable to 256K on board. 512K in all.
- Shugart SA455 drive Double sided double density holds 340K.
- Colour video board
- Floppy controller

Just \$1795

The Loaded **BEST**

The basic **BEST** with

- Two Shugart SA455 drives Shugart double sided double density drives.
- 256K of RAM A quarter megabyte of memory on board.
- RS-232C interface

Just \$2395

The Executive **BEST**

The loaded **BEST** with:

- A 10 megabyte hard drive.

Just \$3895

Does not include Microsoft BASIC or other proprietary software.

Godzilla Meets All the BBS Numbers in the World

The phone numbers of computer bulletin board systems change almost as fast as election promises. This list is the most up to date we could make it and sure to keep your dialing finger going for evenings without end.

by Brian Greiner

And so, the three hundred baud knight took his vorpal sword in hand and went off to slay slithy toves. He carried his gallant albino modem at his side for luck and because it was in the script. Within his armour he trembled despite his gallantry. The dreaded busy signal awaited.

The result of yet another foray of this champion of the phone lines, we present here an updated list of all the BBS numbers in the world with the exception of those that don't pay their phone bills in Canadian paper. All these numbers have been called, and are known to be active... at least they were at press time. The sands of BBS's, however, are forever shifting. Non-business hours should be assumed where no hours are posted. Most businesses need their phone lines from eight o'clock in the morning to five in the afternoon.

We have omitted those boards which overtly support software piracy and system cracking.

Survey of 150 Computers

Once again we are pleased to present our bi-annual survey of systems. This edition sees quite a number of changes in the microcomputer industry, as a few new machines have cropped up... and a number have drifted into the never-never lands of obsolescence and financial insolvency.

In a sense, the last six months have seen a lot of growing up on the part of the companies who build micros... those which have sound products and reliable operations have largely survived the ravages of the economy and galloping technology.

A few, however, have faded away to nothing more than phone numbers no longer in service.

This survey represents some fairly powerful technology. Some of it is brand new, but quite a lot is existing hardware made more capable through innovation and enhancement. No matter what sort of system you're looking for you'll find a number of suitable machines in the next few pages.

Acorn Atom

Operating System: BASIC
Processor(s): 6502
RAM: 2K
Printer I/O: Optional, serial or parallel
Disk Drives Inc.: Optional
Screen Format: 32x16
Graphics: 256x192
Sound: Yes
Colour: Optional
Keyboard: Integrated
Software Included: BASIC
Primary Market: Home
Manufacturer: Acom Computers
Available From: Gladstone Electronics
Suggested Retail: \$99.95; 12K RAM model
Other: \$199.95

Actrix Portable

Operating System: CP/M
Processor(s): Z80A (optional 8088)
RAM: 64K
Printer I/O: Two serial, one parallel and one IEEE
Disk Drives Inc.: Two SS DD drives
Screen Format: 80x25
Graphics: 126 graphics characters
Sound: No
Colour: No
Keyboard: Detachable
Software Included: Perfect Writer/Speller/Calc/Filer; Fancy Font
Weight: 33 lbs.
Primary Market: Business
Manufacturer: Access Matrix Corp.
Available From: Kobetek Systems Ltd.
Suggested Retail: \$3195.00
Other: Built-in 8x9 dot matrix printer

Advanced Personal Computer III

Operating System: MS-DOS
Processor(s): NEC 8086 (8 MHz)
RAM: 128K
Printer I/O: One parallel, one serial
Disk Drives Inc.: One or two 5 1/4" floppy, or hard drive with 5 1/4" floppy
Screen Format: 40/80x25
Graphics: 640x400 pixels; colour and monochrome
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: MS-DOS, GW BASIC
Primary Market: Business
Manufacturer: NEC
Available From: Micro Computers of Canada
Suggested Retail: \$2995.00 for one drive.
Other: \$5995.00; hard drive version
Monitor included

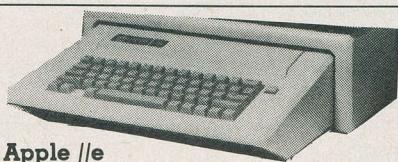

Ajile II

Operating System: MS-DOS
Processor(s): 8088
RAM: 256K
Printer I/O: Serial and parallel
Disk Drives Inc.: Two 5 1/4" DS DD floppy
Screen Format: 80x25
Graphics: 640x250 pixels
Sound: Programmable
Colour: No
Keyboard: Detachable
Software Included: In:Scribe, Multiplan
Weight: 9.6 kg.
Primary Market: Business
Manufacturer: Bytec-Comterm
Available From: Anderson Jacobson
Suggested Retail: \$3190.00
Other: Single drive version; \$2730.00

Apple //c

Operating System: BASIC
Processor(s): 65C02
RAM: 128K
Printer I/O: Serial
Disk Drives Inc.: One SSD 5 1/4" floppy
Screen Format: 40/80x24
Graphics: 280/560x192 pixels
Sound: Yes; volume control and headphone jack
Colour: Yes
Keyboard: Integrated
Software Included: Four disk introduction, system utilities
Weight: 3.4 Kilograms
Primary Market: Home
Manufacturer: Apple Computer
Available From: Local dealers
Price: \$1895.00
Other: No slots. Ports for printer, second drive, modem, RGB monitor or television, composite monitor, mouse or joystick/paddles.

Apple //e

Operating System: BASIC
Processor(s): 6502A
RAM: 64K
Printer I/O: Optional serial or parallel
Disk Drives Inc.: Optional
Screen Format: 40x24; Optional 80x24
Graphics: 280/560x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: BASIC
Primary Market: Business and home
Manufacturer: Apple Computer
Available From: Local dealers
Suggested Retail: \$1295.00
Other: Self-test mode

Apple //I+

Operating System: BASIC
Processor(s): 6502B
RAM: 256K
Printer I/O: Serial
Disk Drives Inc.: One 5 1/4" DD floppy
Screen Format: 80x24
Graphics: 560x192
Sound: Optional
Colour: Optional
Keyboard: Integrated
Software Included: SOS
Primary Market: Business
Manufacturer: Apple Computer
Available From: Local dealers
Suggested Retail: \$4295.00; business unit
Other: \$6495.00
Business unit has 5 megabyte hard drive, monitor and Catalyst software

Apple Lisa 2

Operating System: Integrated icon software
Processor(s): 68000
RAM: 512K
Printer I/O: 2 serial, 1 parallel
Disk Drives Inc.: One 3 1/2" microfloppy
Screen Format: Variable
Graphics: 720x360 pixels
Sound: Yes
Colour: No
Keyboard: Detachable
Software Included: Macintosh Operating System
Primary Market: Business
Manufacturer: Apple Computer
Available From: Local dealers
Suggested Retail: \$4995.00
Other: Can run Macintosh software

Apple Lisa 2/5

Operating System: Integrated icon software
Processor(s): 68000
RAM: 512K
Printer I/O: 2 serial, 1 parallel
Disk Drives Inc.: One 3 1/2" floppy, one 5 megabyte hard disk
Screen Format: Variable
Graphics: 720x360 pixels
Sound: Yes
Colour: No
Keyboard: Detachable
Software Included: N/A
Primary Market: Business
Manufacturer: Apple Computer
Available From: Local Dealers
Suggested Retail: \$6495.00
Other: Can run Macintosh software

Apple Lisa 2/10

Operating System: Integrated icon software
Processor(s): 68000
RAM: 512K
Printer I/O: 2 serial, 1 parallel
Disk Drives Inc.: One 3 1/2" floppy, one 10 mb hard disk
Screen Format: Variable
Graphics: 720x360
Sound: Yes
Colour: No
Keyboard: Detachable
Software Included: N/A
Primary Market: Business
Manufacturer: Apple Computer
Available From: Local dealers
Suggested Retail: \$7995.00
Other: Can run Macintosh software

Apple Macintosh

Operating System: Macintosh Operating System
Processor(s): 68000
RAM: 128K
Printer I/O: Serial
Disk Drives Inc.: One 3 1/2" drive standard
Screen Format: Variable
Graphics: 512x342 pixels
Sound: Yes
Colour: No
Keyboard: Detachable
Software Included: Graphics and word processing
Weight: 17 lbs.
Primary Market: Home, business, educational
Manufacturer: Apple Computer Corp.
Available From: Apple Canada
Suggested Retail: \$3595.00; \$4295.00 with imagewriter printer
Other: Visually-oriented; mouse included

Associate

Operating System: CP/M or MS-DOS, CP/M-86
Processor(s): Z80A or optional 8088
RAM: 128K
Printer I/O: 3 serial, one IEEE, optional parallel
Disk Drives Inc.: Two DS DD 5 1/4" floppy or optional 10 mb hard drive
Screen Format: 80x25 or 132x25
Graphics: 32 graphics characters, 256 user definable
Sound: Yes
Colour: Optional
Keyboard: Integrated
Software Included: Microplan, Spellbinder, acc pak
Primary Market: Business or personal
Manufacturer: Associate
Available From: Datacal Technology Ind Corp.
Suggested Retail: \$4495.00
Other: 114 function keys

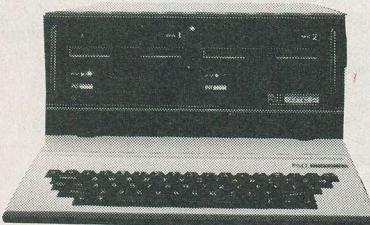

Atari 600XL

Operating System: BASIC
Processor(s): 6502
RAM: 16K
Printer I/O: Parallel
Disk Drives Inc.: Optional disk drive or recorder
Screen Format: 40x24
Graphics: 320x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: BASIC
Primary Market: Home
Manufacturer: Atari
Available From: Irwin Electronics
Price: \$239.00
Other: CP/M option

Atari 800 XL

Operating System: BASIC
Processor(s): 6502
RAM: 64K
Printer I/O: Serial
Disk Drives Inc.: Optional
Screen Format: 40x24
Graphics: 280x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: BASIC
Primary Market: Home or Business
Manufacturer: Atari
Available From: Irwin Electronics
Price: From \$399.00 to 449.00
Other: CP/M optional

AVT Comp 2

Operating System: BASIC and CP/M
Processor(s): 6502 and Z80A
RAM: 64K
Printer I/O: Optional serial or parallel
Disk Drives Inc.: One 5 1/4" floppy
Screen Format: 40x24
Graphics: 280x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable; 8 function keys
Software Included: BASIC
Primary Market: Personal or business
Manufacturer: AVT, Switzerland
Available From: Bee Microsystems
Suggested Retail: \$1495.00 including monitor
Other: Apple compatible

BEE PC

Operating System: CP/M-86 and MS-DOS
Processor(s): 8088 and Z80
RAM: 128K
Printer I/O: One parallel and two serial
Disk Drives Inc.: One 5 1/4" DS DD floppy
Screen Format: 40/80x24 pixels
Graphics: 640x320
Sound: Yes
Colour: Yes
Keyboard: Detachable

Software Included: 2 BASICs
Primary Market: Business
Manufacturer: Canon
Available From: Office Equipment
Suggested Retail: \$3525.00
Other: Available with colour ink jet printer

SMITH-CORONA JUST NARROWED YOUR CHOICE OF COMPUTER PRINTERS DOWN TO FIVE.

Introducing the personal computer printers you've been waiting for. From Smith-Corona.

Each one is remarkable. Each one affordable. Each one designed to meet very particular needs. Starting with the need for speed.

They're fast workers. Put words and numbers on paper at the crisp rate of 140 characters per second with the new Smith-Corona D-300 Dot Matrix Printer. Or as fast as 120 characters per second with the D-200 and D-100.

Compatible partners. The new Smith-Corona printers work perfectly with most major computers. Including IBM, Apple, Commodore and more. Four of these printers

feature a Dual Interface to ensure wide compatibility. The fifth, the Smith-Corona Fastex 80 Dot Matrix Printer, offers Parallel Interface.

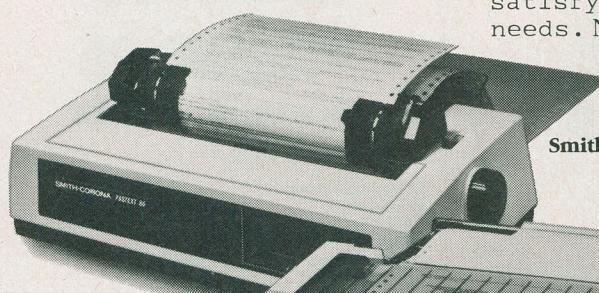

High quality printers. As you can see, the new Smith-Coronas deliver outstanding results. Even at high speeds. **This Dot Matrix print out is as close to letter quality as you can get.** While the L-1000 Daisy Wheel model produces documents that satisfy your most critical needs. Naturally, since document

sizes vary, our paper capacity varies too. From standard 8½" computer paper to 15" widths. (And even smaller sizes when sheet-fed.)

And a reliable investment, all down the line. Because we're Smith-Corona, you get reliability and workmanship second to none. Our national service network is as near as your phone.

So why waste time? To get down to serious computing around your home or office, look into the new line of personal printers from Smith-Corona. Your choice will be easier than you think.

For more information about the full line of new Smith-Corona printers, call your nearest authorized Smith-Corona dealer. Or fill in and mail the coupon below.

Smith-Corona Fastex 80

Smith-Corona D-200

Smith-Corona L-1000

Smith-Corona D-300

JUKI®

If The Quality Wasn't So Great...

You Could Almost Call It

**Juki Model 6100 daisywheel printers
are fully featured and priced right.**

- Compatible with most personal computers—IBM®, Apple®, Commodore®, Kaypro®, etc.
- Bidirectional
- Lightweight
- 2K buffer (expandable to 8K)
- Graphic capability
- Bidirectional tractor-feed option
- Proportional spacing
- Centronics® parallel interfaces standard; RS-232 serial card (pluggable) option
- Uses inexpensive, easy-to-find IBM Selectric II® ribbon
- Quiet
- Easy-to-understand user's manual
- Bold face, subscript, superscript & shadow printing for word processing
- Costs less than \$850

Distributed in Canada by Canadian General Electric—Data Systems

IBM and IBM Selectric II are registered trade marks of International Business Machines Corporation.
Apple is a registered trade mark of Apple Computer Inc.

Commodore is a registered trade mark of Commodore Business Machines Ltd.
Kaypro is a registered trade mark of Non-Linear Systems Inc.
Centronics is a registered trade mark of Centronics Data Computer Corp.

**Ask your computer dealer to show you
the exciting, economical, hard-working
JUKI 6100 daisywheel printer today.**

Commodore VIC 20

Operating System:	BASIC
Processor(s):	6502
RAM:	5K
Printer I/O:	Serial
Disk Drives Inc.:	Optional 1541 SSSD floppy
Screen Format:	22x23
Graphics:	178x184
Sound:	Yes
Colour:	Yes
Keyboard:	Integrated
Software Included:	BASIC
Primary Market:	Home
Manufacturer:	Commodore
Available From:	Local retailers
Suggested Retail:	\$99.95 without datasette

Copam PC-301

Operating System:	MS-DOS
Processor(s):	8088
RAM:	256K
Printer I/O:	One parallel, two serial
Disk Drives Inc.:	Two floppy
Screen Format:	40/80x25

Other:	IBM compatible

Corona PC

Operating System:	MS-DOS
Processor(s):	8088
RAM:	256K
Printer I/O:	Serial and parallel
Disk Drives Inc.:	Two DSDD floppy
Screen Format:	80x24
Graphics:	640x325 pixels
Sound:	Yes
Colour:	Optional
Keyboard:	Detachable
Software Included:	Multimate 3.26, MS-DOS 2.0
Primary Market:	Business
Manufacturer:	Corona
Available From:	Scardsale Technology, CDI
Suggested Retail:	\$3225.00 - \$3990.00; Hard disk version \$5995.00
Other:	Can mix text and graphics

Corona Portable

Operating System:	MS-DOS
Processor(s):	8088
RAM:	256K
Printer I/O:	Serial and parallel; four exp. slots
Disk Drives Inc.:	Two DD floppy
Screen Format:	80x24
Graphics:	640x325 pixels
Sound:	Yes
Colour:	No
Keyboard:	Detachable
Software Included:	MS-DOS 2.0, Multimate 3.26
Weight:	28 lbs.
Primary Market:	Business
Manufacturer:	Corona
Available From:	Scardsale, CPI
Suggested Retail:	\$3225.00 - \$3990.00; Hard disk version \$5995.00

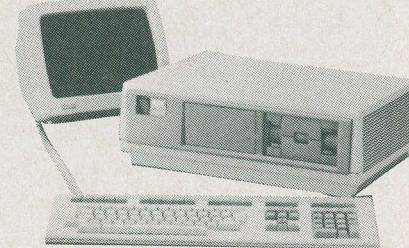

Cromemco C-10SP

Operating System:	CP/M COMP
Processor(s):	Z80A
RAM:	64K
Printer I/O:	Serial and parallel
Disk Drives Inc.:	Two DS DD floppy drives
Screen Format:	80x25
Graphics:	N/A
Sound:	No
Colour:	No
Keyboard:	Detachable
Software Included:	BASIC, word processor, spreadsheet
Primary Market:	Business
Manufacturer:	Cromemco
Available From:	Computerland
Suggested Retail:	\$1785.00

Data-2000

Operating System:	Proprietary
Processor(s):	Proprietary 4-bit CPU
RAM:	2K CMOS
Printer I/O:	N/A
Disk Drives Inc.:	N/A
Screen Format:	10x4
Graphics:	10 graphics characters in ROM
Sound:	Yes
Colour:	No
Keyboard:	Separate from watch
Software Included:	N/A
Primary Market:	Business, students
Manufacturer:	Hattori-Seiko Company Ltd.
Available From:	SC Time Canada
Approximate Retail:	\$260.00 with keyboard and batteries
Other:	4-function calculator, calendar, data entry, contrast adjustment

DEC Decmate II

Operating System:	Proprietary DOS
Processor(s):	12 bit 6120
RAM:	96K
Printer I/O:	Serial
Disk Drives Inc.:	Two 5 1/4" floppy
Screen Format:	80/132x24
Graphics:	N/A
Sound:	No
Colour:	Optional
Keyboard:	Detachable
Software Included:	WPS, CP/M
Primary Market:	Business
Manufacturer:	Digital Equipment
Available From:	Local Dealers
Suggested Retail:	\$10,000

DEC Rainbow 100

Operating System:	CP/M-86 or MS-DOS
Processor(s):	Z80 and 8088
RAM:	128K
Printer I/O:	Serial
Disk Drives Inc.:	One drive accommodating two 5 1/4" disks
Screen Format:	80/132x24
Graphics:	Optional; 800x240 pixels
Sound:	No
Colour:	Optional; palette of 1,024 colours
Keyboard:	Detachable
Software Included:	Choice of CP/M-86 or MS-DOS
Primary Market:	Business
Manufacturer:	Digital Equipment
Available From:	Local Dealers
Suggested Retail:	\$4600.00

DEC Rainbow 100+

Operating System:	CP/M-86/80 or MS-DOS
Processor(s):	Z80 and 8088
RAM:	128K
Printer I/O:	Serial
Disk Drives Inc.:	One dual-diskette drive, one 10 Mb hard
Screen Format:	80/132x24
Graphics:	Optional; 800x240 pixels
Sound:	No
Colour:	Optional; palette of 4,096 colours
Keyboard:	Detachable
Software Included:	Choice of CP/M-86 or MS-DOS
Primary Market:	Business
Manufacturer:	Digital Equipment
Available From:	Local dealers
Price:	\$7500.00

Dimension 68000

Operating System:	CP/M-68K
Processor(s):	68000L8
RAM:	256K
Printer I/O:	One serial, one parallel
Disk Drives Inc.:	Two 5 1/4" DS DD floppy
Screen Format:	20x20 to 100x50
Graphics:	160x480 pixels to 640x480 pixels
Sound:	Yes
Colour:	Yes
Keyboard:	Detachable
Software Included:	BASIC, CP/M-68K, C, 68000 assembler
Primary Market:	Business
Manufacturer:	Micro Craft Corporation
Available From:	Popular Electronic Products
Suggested Retail:	\$6495.00; 512K version with all emulation packages is \$7995.00
Other:	Can emulate Apple II+, IBM PC, Kaypro, Osborne and others with optional hardware and software.

ATTENTION RETAILERS

Let B & R Enterprises Inc. solve all your software problems

As one of Canada's Largest and Experienced Distributors we care about you, your Software and Peripheral needs. We work at keeping our DEALERS Satisfied & Happy.

MAKING B & R DEALER FRIENDLY

We offer a complete line of tested and proven products tested on our own premises by our highly qualified staff waiting to give Top Notch Service and Technical Support to you our DEALERS.

Just pick up your phone and you will receive the right Kind of Service. Fast efficient service, Fast Delivery, Fantastic Support from our staff of software and peripheral Pros. Shipped from one of our warehouses – nearest to your location – well stocked with the most popular up to date products. We feel so confident that our software will sell, that we GUARANTEE to replace any of the software products that you buy from B & R Enterprises Inc. **INQUIRE ABOUT OUR STOCK ROTATION PROGRAMME.**

We also offer you, our dealer, Merchandising Support. **WRITE OR PHONE FOR OUR LATEST CATALOGUE TODAY.** You will be amazed at our low prices and Special Dealer Promotions.

Processor(s): 6502 and Z80A
RAM: 128K
Printer I/O: Optional serial or parallel
Disk Drives Inc: Optional 5 1/4" floppy
Screen Format: 40/80x24
Graphics: 280x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: BASIC
Primary Market: Business or home
Manufacturer: Peach Microsystems
Available From: Peach Microsystems
Suggested Retail: \$1249.00
Other: Disk controller on board

Peach Executive

Operating System: BASIC
Processor(s): 6502 and Z80A
RAM: 128K
Printer I/O: Optional serial or parallel
Disk Drives Inc: N/A
Screen Format: 40/80x24
Graphics: 280x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: BASIC
Primary Market: Business
Manufacturer: Peach Microsystems
Available From: Peach Microsystems
Suggested Retail: \$1449.00

Persona 16

Operating System: MS-DOS
Processor(s): 8088
RAM: 128K, expandable to 512K
Printer I/O: One serial, one parallel and an optional 2nd serial
Disk Drives Inc: Two 5 1/4" double density disk drives
Screen Format: 80x25
Graphics: Colour 600x200 pixels, monochrome 720x350 pixels
Sound: Yes
Colour: Optional
Keyboard: Detachable
Software Included: MS-DOS
Primary Market: Business
Manufacturer: Nelma Data Corporation
Available From: Nelma Data Corporation
Suggested Retail: \$3995.00
Other: Clock with rechargeable battery backup. IBM software and hardware compatible.

Philips PC

Operating System: MS-DOS 1.25
Processor(s): 8088
RAM: 128K
Printer I/O: Parallel and serial
Disk Drives Inc: Two 5 1/4" floppy
Screen Format: 40/80x25
Graphics: 640x325 pixels
Sound: Yes
Colour: Optional
Keyboard: Detachable
Software Included: Multi-Mate, GW BASIC, PC Tutor, MS-DOS
Primary Market: Business
Manufacturer: Corona
Available From: Philips Information Systems
Suggested Retail: \$3665.00; 256K version running MS-DOS 2.0 is \$3990.00
Other: Four expansion slots. Monitor included.

Pied Piper

Operating System: CP/M
Processor(s): Z80A
RAM: 64K
Printer I/O: Parallel
Disk Drives Inc: One 5 1/4" floppy
Screen Format: 80x24
Graphics: 10 graphics characters
Sound: No
Colour: No
Keyboard: Integrated
Software Included: Perfect Writer/Speller/Filer/Calc
Weight: 12.5 lbs.
Primary Market: Home or business
Manufacturer: Semi-Tech Microelectronics
Available From: Semi-Tech Microelectronics
Suggested Retail: \$1799.00

Almost Free PC Software

Our Almost Free Software disks, volumes one through three, for systems running CP/M have been so thunderingly popular that we have assembled a volume for IBM PC users. The considerably greater power of a sixteen bit system, coupled with its larger capacity disk drives, have enabled us to offer a collection of programs that will knock the socks off virtually any sentient life form booting the disk. Be warned... wear sandals when you unwrap this thing.

This software will run superbly on genuine IBM PC's and compatible systems.

PC-WRITE While not quite Wordstar for nothing, this package comes extremely close to equaling the power of commercial word processors costing five or six bills. It has full screen editing, cursor movement with the cursor mover keypad, help screens and all the features of the expensive trolls.

SOLFE This is a small BASIC program that plays baroque music. While it has little practical use, it's just a kick to tootle with. It's also a fabulous tutorial on how to use BASICA's sound statements.

PC-TALK Telecommunications packages for the IBM PC are typically intricate, powerful and huge. This one is no exception. It has menus for everything and allows full control of all its parameters, even the really silly ones. It does file transfers in both ASCII dump and MODEM7/X-MODEM protocols and comes with... get this... 119424 bytes of documentation.

SD This sorted directory program produces displays which are a lot more readable than those spewed out by typing DIR. It's essential to the continued maintenance of civilization as we know it.

FORTH This is a small FORTH in Microsoft BASIC. It's good if you want to get used to the ideas and concepts of FORTH... you can build on the primitives integral with the language.

LIFE This is an implementation of the classic ecology game written in 8088 assembler. While you may grow tired of watching the cells chewing on each other, in time the source will provide you with a powerful example of how to write code.

MAGDALEN This is another BASIC music program. We couldn't decide which of the two we've included here was the best trip, so we wound up putting them both on the disk. Ah... the joys of double sided drives.

CASHACC This is a fairly sophisticated cash acquisition and limited accounting package written in BASIC. It isn't exactly BPI, but it's a lot less expensive and suitable for use in most small business applications.

DATAFILE This is a simple data base manager written in... yes, trusty Microsoft BASIC.

UNWS Wordstar has this unusual propensity for setting the high order bits on some of the characters in the files it creates. Looks pretty weird when you try to do something other than Wordstar the file, doesn't it... Here's a utility to strip the bits and "unWordstar" the text. The assembler source for this one is provided.

HOST2 This is a package including the BASIC source and a DOC file to allow users with Smart-Modems to access their PC's remotely. It's a hacker's delight.

The disk also includes various support and documentation files needed to run the software.

We can provide the Almost Free PC Software Disk volume one on either one standard double sided disk or on two single sided ones. [†] The cost for the double sided package is:

Only
\$16.95

† or \$19.95 for two single sided disks

The Computing Now! Almost Free PC Software Disk #1
25 Overlea Boulevard, Suite 601
Toronto, Ontario M4H 1B1

Or telephone your order to (416) 423-3262 using VISA, American Express or Mastercard.

Fine print:

There has to be fine print somewhere or later or the typesetting machine forgets how to do it. All of the software on the Almost Free PC Software Disk #1 has been obtained through public access bulletin boards and is believed to be in the public domain. Some of it is "freeware", and users will find messages imbedded in the code asking for donations on the part of the authors. This is between you and your conscience... hit RETURN and it usually goes away.

This software is offered free of charge. The cost of this package serves only to defer the cost of postage, handling and the disk itself.

Moorshead Publications warrants that the software will be readable. If defects in the medium prevent this, we will replace your disk at no cost. While we have made every effort to assure that these programs are completely debugged, we are unable to assist you in adapting them for your application.

Pied Piper Professional

Operating System: CP/M
Processor(s): Z80A
RAM: 64K
Printer I/O: One serial, one parallel
Disk Drives Inc: Two 5 1/4" floppy
Screen Format: 80x24
Graphics: 10 graphics characters
Sound: No
Colour: No
Keyboard: Integrated
Software Included: CBASIC, Perfect software, terminal package
Software Available: Extensive
Primary Market: Business
Manufacturer: Semi-Tech Microelectronics
Available From: Semi-Tech Microelectronics and local dealers
Suggested Retail: \$2775.00
Other: Monitor stand included

The Portable

Operating System: MS-DOS, P.A.M.
Processor(s): 8086
RAM: 272K
Printer I/O: One serial, one HP-IL
Disk Drives Inc: RAM disk; optional 710K 3 1/2" floppy
Screen Format: 80x16 LCD
Graphics: 480x128 pixels
Sound: Yes
Colour: No
Keyboard: Integrated
Software Included: Lotus 1-2-3, MS-DOS, P.A.M., WP, terminal
Primary Market: Business
Manufacturer: Hewlett-Packard
Available From: Hewlett-Packard
Suggested Retail: \$4598.00

The President

Operating System: Optional; MS-DOS or CP/M-86
Processor(s): 8088
RAM: 128K
Printer I/O: One serial
Disk Drives Inc: Two slimline 5 1/4" floppy
Screen Format: 40/80x24
Graphics: 640x320 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: N/A
Primary Market: Business or Home
Manufacturer: President Computer Corp.
Available From: President Computer Corp.
Suggested Retail: \$3195.00
Other: High resolution monochrome monitor included

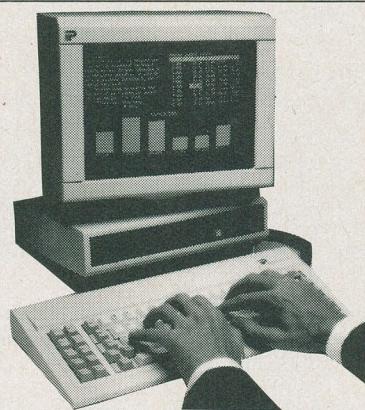

President Ex.

Operating System: N/A
Processor(s): 8088
RAM: 256K
Printer I/O: Two serial and two parallel
Disk Drives Inc: One 20 Mb hard, one 1.6 Mb 5 1/4" floppy, one 360K 5 1/4" floppy
Screen Format: 40/80x25
Graphics: 720x348
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: N/A
Primary Market: Business
Manufacturer: President Computer Corp.
Available From: President Computer Corp.
Suggested Retail: \$7945.00
Other: 256K extra RAM on multi-function card.

President Sr.

Operating System: N/A
Processor(s): 8088
RAM: 256K
Printer I/O: Two serial and two parallel
Disk Drives Inc: One 10 Mb hard disk and two 5 1/4" floppy; one DS DD and one DS QD
Screen Format: 40/80x25
Graphics: 720x348 pixels
Sound: Yes
Colour: No
Keyboard: Detachable
Software Included: N/A
Primary Market: Business
Manufacturer: President Computer Corp.
Available From: President Computer Corp.
Suggested Retail: \$5495.00
Other: Real-time clock/calendar

Pronto 16/10

Operating System: MS-DOS
Processor(s): 80186
RAM: 128K
Printer I/O: 2 serial, 1 parallel, 4 expansion ports
Disk Drives Inc: Two 5 1/4" floppy
Screen Format: 80x25
Graphics: Optional 640x480 pixels
Sound: No
Colour: No
Keyboard: Detachable
Software Included: BASIC, word processor, spreadsheet, more
Primary Market: Business
Manufacturer: Pronto Computers, USA
Available From: Local dealers
Suggested Retail: \$2995.00

QCAL 500

Operating System: BASIC
Processor(s): 6502
RAM: 64K
Printer I/O: Optional serial or parallel
Disk Drives Inc: Cassette interface; optional 5 1/4" floppy
Screen Format: 40x24
Graphics: 280x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: BASIC
Primary Market: Home or business
Manufacturer: QCAL International
Available From: Pacific Rim Electronic Imports
Suggested Retail: \$549.00
Other: Apple compatible

QCAL 900

Operating System: BASIC or CP/M
Processor(s): 6502 and Z80
RAM: 64K
Printer I/O: Optional serial or parallel
Disk Drives Inc: Optional 5 1/4" floppy
Screen Format: 40x24
Graphics: 280x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: BASIC
Primary Market: Business or home
Manufacturer: QCAL International
Available From: Pacific Rim Electronic Imports
Suggested Retail: \$699.00
Other: 94 function keys

QCAL 1000

Operating System: BASIC or CP/M
Processor(s): 6502 and Z80
RAM: 64K
Printer I/O: Optional serial or parallel
Disk Drives Inc: Optional dual 5 1/4" slimline floppy
Screen Format: 40x24
Graphics: 280x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: BASIC
Primary Market: Business or home
Manufacturer: QCAL International
Available From: Pacific Rim Electronic Imports
Suggested Retail: \$849.00
Other: 188 function keys; user defined keys

QCAL 8000

Operating System: N/A
Processor(s): 8088
RAM: 128K
Printer I/O: Five expansion slots
Disk Drives Inc: One DS DD 5 1/4" floppy
Screen Format: 40/80x25
Graphics: N/A
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: N/A
Primary Market: Business
Manufacturer: QCAL International
Available From: Pacific Rim Electronic Imports
Suggested Retail: \$2295.00

Radio Shack PC-4

Operating System: BASIC
Processor(s): Proprietary
RAM: 5K
Printer I/O: Optional
Disk Drives Inc: Optional cassette
Screen Format: 12 character LCD
Graphics: N/A
Sound: No
Colour: No
Keyboard: Integrated
Software Included: BASIC
Primary Market: Business or home
Manufacturer: Tandy
Available From: Radio Shack
Suggested Retail: \$99.95

Robie

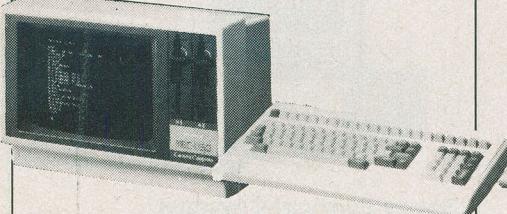

Operating System: CP/M
Processor(s): Z80A
RAM: 64K
Printer I/O: Two serial, one parallel, one phone jack
Disk Drives Inc: Two 2.6 Mb 5 1/4" floppy
Screen Format: 80x25
Graphics: 100x160 pixels
Sound: Yes
Colour: No
Keyboard: Detachable
Software Included: CP/M, BASICs, The Word Plus, WordStar, MicroPlan, SuprTerm, MailMerge, InfoStar, more...

Primary Market: Business
Manufacturer: Kaypro
Available From: Micro Bazaar
Suggested Retail: \$2295.00
Other: Built-in 300 baud auto-answer, auto-dial modem

Sanyo MBC 550/555

Operating System: MS-DOS
Processor(s): 8088
RAM: 128K
Printer I/O: Optional serial
Disk Drives Inc: One 160K 5" floppy (550) or two (555)
Screen Format: 80x25
Graphics: 640x200 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: BASIC, MS-DOS
Primary Market: Home or business
Manufacturer: Sanyo
Available From: Astris Science Inc.
Suggested Retail: \$1495.00 (550); \$1995.00 (555)
Other: With 360K drives, the 550-2 and 555-2 are \$1795.00 and \$2495.00 respectively.

Sanyo MBC 1100/1150

Operating System: CP/M 2.2
Processor(s): Z80A
RAM: 64K
Printer I/O: Parallel and serial
Disk Drives Inc: One 5 1/4" floppy (1100) or two (1150)
Screen Format: 80x25
Graphics: N/A
Sound: No
Colour: No
Keyboard: Detachable
Software Included: CP/M 2.2 and BASIC
Primary Market: Business
Manufacturer: Sanyo
Available From: Astris Science Inc.
Suggested Retail: \$2595.00 (1100 model)
Other: \$3195.00 (1150 model)

Sanyo MBC 1200/1250

Operating System: CP/M 2.2
Processor(s): Two Z80A, one 8048 (keyboard)
RAM: 64K
Printer I/O: Parallel and serial
Disk Drives Inc: One DS DD 5 1/4" floppy (1200) or two (1250)
Screen Format: 80x33/40
Graphics: 640x400 pixels
Sound: No
Colour: No
Keyboard: Detachable
Software Included: CP/M and BASIC
Primary Market: Business
Manufacturer: Sanyo
Available From: Astris Science Inc.
Suggested Retail: \$3195.00 (1200 model)
Other: \$3995.00 (1250 model)

Sanyo 4000/4050

Operating System: CP/M-86
Processor(s): 8086 and 8048 (keyboard)
RAM: 128K
Printer I/O: Serial and parallel
Disk Drives Inc: One 5 1/4" DSDD floppy (4000) or two (4050)
Screen Format: 80x25
Graphics: No
Sound: No
Colour: No
Keyboard: Detachable
Software Included: CP/M-86 and BASIC
Software Available: Extensive
Primary Market: Business
Manufacturer: Sanyo
Available From: Astris Science Inc.
Suggested Retail: \$3795.00 (4000 model)
Other: \$4795.00 (4050 model)

Seequa PC

Operating System: MS-DOS 1.25 or CP/M 80
Processor(s): 8088 and Z80
RAM: 128K
Printer I/O: Serial and parallel
Disk Drives Inc: One DS DD 5 1/4" floppy
Screen Format: 40/80x25
Graphics: 320/640x200 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: Same as Chameleon
Primary Market: Business
Manufacturer: Seequa Computer Corporation
Available From: Local Dealers
Suggested Retail: \$1995.00
Other: 9" monitor

Seequa XT

Operating System: MS-DOS 2.0 or CP/M 80
Processor(s): Z80 and 8088
RAM: 256K
Printer I/O: Serial and parallel; four expansion slots
Disk Drives Inc: One DS DD 5 1/4" floppy, one 10 Mb hard drive
Screen Format: 80x24
Graphics: 320/640x200 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: Same as Chameleon Plus
Primary Market: Business
Manufacturer: Seequa
Available From: York Computers
Suggested Retail: \$5500.00
Other: 9" monitor

Sharp PC 1500

Operating System: BASIC
Processor(s): C-MOS
RAM: 2.6K
Printer I/O: Optional printer/cassette interface
Disk Drives Inc: Optional printer/cassette interface
Screen Format: 26x1 LCD
Graphics: 7x156 pixels
Sound: Yes
Colour: No
Keyboard: Integrated
Software Included: BASIC
Primary Market: Home or business
Manufacturer: Sharp
Available From: Total Office Systems
Suggested Retail: \$299.95
Other: Battery operated

Sharp PC 5000

Operating System: MS-DOS
Processor(s): 8088 and C-MOS
RAM: 128K
Printer I/O: Serial
Disk Drives Inc: Opt. 128K bubble cartridge
Screen Format: 80x8 LCD
Graphics: 640x80 pixels
Sound: No
Colour: No
Keyboard: Integrated
Software Included: N/A
Weight: 5 kg.
Primary Market: Business
Manufacturer: Sharp Electronics
Available From: Total Office Systems
Suggested Retail: \$2695.00, not including printer and drive

Sharp YX 3200

Operating System: CP/M and FDOS
Processor(s): YX-3200
RAM: 64K
Printer I/O: Parallel and serial expansion
Disk Drives Inc: Optional 5 1/4" or 8" floppy
Screen Format: 80x25
Graphics: N/A
Sound: No
Colour: No
Keyboard: Integrated
Software Included: Two BASICs
Primary Market: Home or Business
Manufacturer: Sharp
Available From: Total Office Systems
Suggested Retail: \$2395.00

Sinclair ZX-81

Operating System: BASIC
Processor(s): Z80
RAM: 1K
Printer I/O: Expansion port for ZX-Printer
Disk Drives Inc: Cassette based
Screen Format: 32x16
Graphics: 32 graphic characters
Sound: No
Colour: No
Keyboard: Integrated
Software Included: BASIC
Primary Market: Home
Manufacturer: Sinclair
Available From: Gladstone Electronics
Suggested Retail: \$49.95

Other: Original version of T/S 1000

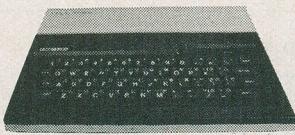

Sony SMC-70

Operating System: CP/M
Processor(s): Z80A
RAM: 64K
Printer I/O: Serial, parallel, five expansion ports
Disk Drives Inc: Optional SS DD 3 1/2" floppy
Screen Format: 80x25
Graphics: 640x400 pixels
Sound: Yes
Colour: Optional
Keyboard: Detachable
Software Included: CP/M
Primary Market: Business
Manufacturer: Sony
Available From: Sony Canada Ltd.
Suggested Retail: \$1895.00 base price
Other: Single drive \$2790; dual drive \$3390

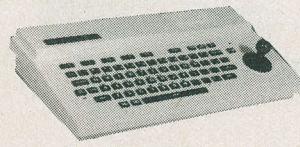

Sord M68

Operating System: N/A
Processor(s): MC68000, Z80A
RAM: 256K
Printer I/O: Two serial, parallel, IEEE bus
Disk Drives Inc: Two 5" mini floppy
Screen Format: 80x25
Graphics: 640x400 pixels
Sound: No
Colour: Optional
Keyboard: Detachable
Software Included: N/A
Primary Market: Business
Manufacturer: Sord
Available From: Micos Computer Systems, Inc.
Suggested Retail: \$7294.00

Sord M5

Operating System: BASIC
Processor(s): Z80A
RAM: 20K
Printer I/O: Parallel
Disk Drives Inc: Optional cassette
Screen Format: 40x24 (TV)
Graphics: N/A
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: BASIC
Primary Market: Home
Manufacturer: Sord
Available From: Micos Computer Systems Inc.
Suggested Retail: \$331.00
Other: Sprite graphics

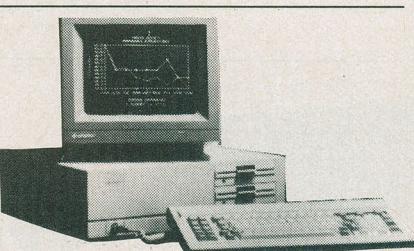

Spectravideo SV-318

Operating System: BASIC
Processor(s): Z80A
RAM: 32K
Printer I/O: Expansion bus
Disk Drives Inc: Cassette driven; optional floppy
Screen Format: 40x24
Graphics: 256x192, 32 sprites
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: BASIC
Software Available: Extensive
Primary Market: Home
Manufacturer: Spectravideo
Available From: Spectravideo
Suggested Retail: \$399.00 with data cassette and software
Other: Integrated joystick

Solution 5000 PC

Operating System: MS-DOS 2.11
Processor(s): 8088
RAM: 128K, 256K for portable model
Printer I/O: One serial, one parallel, 5 slots
Disk Drives Inc: Two 360K DS DD 5 1/4" floppy
Screen Format: 40/80x25
Graphics: 640x200 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: MS-DOS, Electric Pencil, K.I.S.
Primary Market: Accounting, future packages free of charge
Manufacturer: Business
Available From: Ace Micro-Electronics Corporation
Suggested Retail: Prices start at \$2495.00
Other: One year warranty

Sperry Personal Computer

Operating System: MS-DOS
Processor(s): 8088
RAM: 128K
Printer I/O: Serial
Disk Drives Inc: One or two 5 1/4" floppy or 10 mb hard
Screen Format: 40/80x25
Graphics: 320x200, 320x400, 640x200 or 640x400 pixels
Sound: No
Colour: Yes
Keyboard: Detachable
Software Included: MS-DOS
Primary Market: Business
Manufacturer: Sperry Inc.
Available From: Sperry Inc.
Suggested Retail: \$3970.00
Other: Five configurations available

Spectravideo SV-328

Operating System: Microsoft BASIC
Processor(s): Z80A
RAM: 80K
Printer I/O: Optional expander available
Disk Drives Inc.: Cassette driven. Optional 5 1/4" floppy
Screen Format: 40x24. Optional 80 column cartridge
Graphics: 256x192 pixels; 32 sprites
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: BASIC
Primary Market: Home/business
Manufacturer: Spectravideo
Available From: Spectravideo Canada
Suggested Retail: \$599.00
Other: CP/M compatible

STM Personal Computer

Operating System: MS-DOS 2.11
Processor(s): 80186 (8 MHz)
RAM: 256K
Printer I/O: One parallel, two serial. Integrated printer.
Disk Drives Inc.: Two 720K (formatted) DS DD 5 1/4" drives
Screen Format: 80x25 LCD
Graphics: 640x200 pixels colour, 720x348 pixels monochrome
Sound: Yes; hands-free telephone
Colour: Yes
Keyboard: Detachable
Software Included: MS-DOS, telephone/modem support
Primary Market: Business
Manufacturer: Semi-Tech Microelectronics Corporation
Available From: Local dealers
Suggested Retail: \$3699.00
Other: Integrated auto-dial/auto-answer modem, RGB/composite output

TAVA PC

Operating System: N/A
Processor(s): 8088
RAM: 64K
Printer I/O: Two serial, one parallel
Disk Drives Inc.: One 5 1/4" floppy
Screen Format: 40/80x25
Graphics: 640x320 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: N/A
Primary Market: Business
Manufacturer: TAVA Canada Inc.
Available From: Nielsen Computers Inc.
Suggested Retail: \$2995.00
Other: Monitor included

Telcon Zorba

Operating System: CP/M
Processor(s): Z80A
RAM: 64K
Printer I/O: IEEE, parallel and serial
Disk Drives Inc.: Two 5 1/4" DS DD drives
Screen Format: 80x25
Graphics: N/A
Sound: No
Colour: No
Keyboard: Detachable
Software Included: WordStar, MailMerge, CalcStar
Software Available: Extensive
Weight: 22 lbs.
Primary Market: Business
Manufacturer: Telecon Ind. Inc.
Available From: Micro Bazaar
Suggested Retail: \$2995.00
Other: Full and half intensity monitor

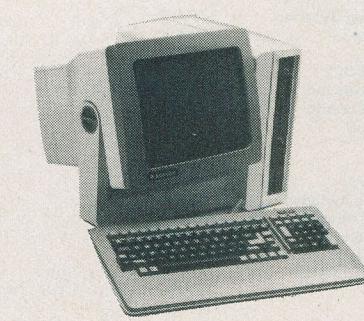

Telcon Zorba

Operating System: CP/M
Processor(s): Z80A
RAM: 64K
Printer I/O: IEEE, parallel and serial
Disk Drives Inc.: Two 5 1/4" DS DD drives
Screen Format: 80x25
Graphics: N/A
Sound: No
Colour: No
Keyboard: Detachable
Software Included: WordStar, MailMerge, CalcStar
Weight: 22 lbs.
Primary Market: Business
Manufacturer: Telecon Ind. Inc.
Available From: Micro Bazaar
Suggested Retail: \$2995.00
Other: Full and half intensity monitor

Televideo TPC 1

Operating System: CP/M
Processor(s): Z80A
RAM: 64K
Printer I/O: Serial
Disk Drives Inc.: One 5 1/4" floppy drive
Screen Format: 80x24
Graphics: 640x240 pixels
Sound: No
Colour: No
Keyboard: Detachable
Software Included: GSX-80 Graphics, word processing, spreadsheet
Weight: 25 lbs.
Primary Market: Business
Manufacturer: Televideo
Available From: Datamex
Suggested Retail: \$3200.00 (2 drives)

Televideo TS 803

Operating System: CP/M
Processor(s): Z80A
RAM: 64K
Printer I/O: Serial
Disk Drives Inc.: Two 5 1/4" floppy
Screen Format: 80x24
Graphics: 640x240 pixels
Sound: No
Colour: No
Keyboard: Detachable
Software Included: CP/M
Primary Market: Business
Manufacturer: Televideo
Available From: Datamex
Suggested Retail: \$704.00
Other: TS 803H (One floppy, one 10 Mb hard) \$5936.00

Televideo TS 1603

Operating System: CP/M
Processor(s): 8088
RAM: 128K
Printer I/O: Serial
Disk Drives Inc.: Two 5 1/4" floppy
Screen Format: 80x24
Graphics: Optional
Sound: No
Colour: No
Keyboard: Detachable
Software Included: CP/M-86 and MMM Ost
Software Included: Extensive
Primary Market: Business
Manufacturer: Televideo
Available From: Datamex
Suggested Retail: \$4420.00

TEO Tiger 4000

Operating System: BASIC
Processor(s): 6502 and Z80A
RAM: 64K
Printer I/O: Optional serial or parallel
Disk Drives Inc.: Optional 5 1/4" floppy or cassette
Screen Format: 40x24
Graphics: 280x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: Spreadsheet, word processor
Primary Market: Home or business
Manufacturer: TEO Computers
Available From: TEO Computers
Suggested Retail: \$1595.00
Other: Apple compatible

TEO Tiger Personal

Operating System: BASIC
Processor(s): 6502 and Z80A
RAM: 64K
Printer I/O: Optional serial or parallel
Disk Drives Inc.: Two 5 1/4" floppy
Screen Format: 40x24
Graphics: 280x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: N/A
Primary Market: Home or Business
Manufacturer: TEO Computers
Available From: TEO Computers
Suggested Retail: \$1595.00
Other: Apple compatible

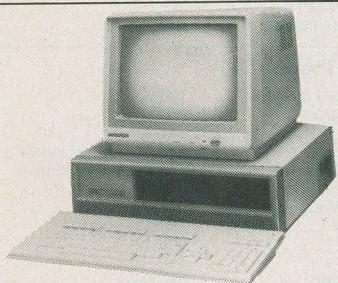

TEO TPC 8300

Operating System: BASIC
Processor(s): CMOS
RAM: 6K
Printer I/O: Parallel
Disk Drives Inc.: Printer/plotter/cassette interface available
Screen Format: 48x2 LCD
Graphics: 255 graphic characters
Sound: No
Colour: No
Keyboard: Integrated
Software Included: Extended Pocket BASIC
Primary Market: Business
Manufacturer: TEO Computers
Available From: TEO Computers
Suggested Retail: \$449.00
Other: Portable; battery or adapter powered

Texas Instruments Portable

Operating System: MS-DOS
Processor(s): 8088
RAM: 128K
Printer I/O: Serial and parallel
Disk Drives Inc.: One half-height 5 1/4" floppy
Screen Format: 80x25
Graphics: 720x300 pixels
Sound: Yes
Colour: Optional
Keyboard: Detachable
Software Included: MS-DOS
Weight: 29 lbs.
Primary Market: Business
Manufacturer: Texas Instruments
Available From: Texas Instruments
Suggested Retail: \$3475.00

TI Professional Computer

Operating System: Choice of MS-DOS, CP/M-80, CP/M-86, UCSD
Processor(s): 8088
RAM: 128K
Printer I/O: Serial, five expansion ports
Disk Drives Inc.: One 5 1/4" floppy
Screen Format: 80x25
Graphics: 720x300 pixels
Sound: No
Colour: Optional
Keyboard: Detachable
Software Included: Variable
Primary Market: Business
Manufacturer: Texas Instruments
Available From: Authorized dealers
Suggested Retail: \$3445.00
Other: Voice management system available

Toshiba T-100

Operating System: CP/M
Processor(s): Z80A
RAM: 64K
Printer I/O: Serial and parallel
Disk Drives Inc.: Two 5 1/4" DS DD floppy
Screen Format: 80x25
Graphics: 640x200 pixels
Sound: No
Colour: Optional
Keyboard: Detachable
Software Included: Two BASICs, spreadsheet, word processor and data base
Primary Market: Business
Manufacturer: Toshiba
Available From: Irwin Electronics
Suggested Retail: \$2500.00

Toshiba T-300

Operating System: MS-DOS
Processor(s): 8088
RAM: 192K; expandable to 512K
Printer I/O: One serial, one parallel
Disk Drives Inc.: One 5 1/4" DD floppy
Screen Format: 80x25
Graphics: 640x500 pixels
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: MS-DOS and TBASIC
Primary Market: Business
Manufacturer: Toshiba
Available From: Irwin Electronics, Infinite Canada Inc.
Suggested Retail: \$3500.00
Other: Programmable function keys

TRS-80 Model 4

Operating System: TRSDOS
Processor(s): Z80A
RAM: 64K
Printer I/O: Parallel
Disk Drives Inc.: Two SS DD 5 1/4" floppy
Screen Format: 80x24
Graphics: Optional 640x240 pixels
Sound: Programmable
Colour: No
Keyboard: Integrated
Software Included: TRSDOS, BASIC
Primary Market: Business
Manufacturer: Tandy
Available From: Radio Shack
Suggested Retail: \$1999.00

TRS-80 Model 4P

Operating System: Microsoft 5.0, TRSDOS 6.0
Processor(s): Z80A
RAM: 64K
Printer I/O: Parallel
Disk Drives Inc.: Two 5 1/4" floppy drives
Screen Format: 80x24
Graphics: Optional 640x240 pixel graphics
Sound: Yes
Colour: No
Keyboard: Detachable
Software Included: Operating systems
Weight: 25 lbs.
Primary Market: Business
Manufacturer: Tandy
Available From: Radio Shack
Suggested Retail: \$1999.00
Other: Model III and Model 4 compatible

TRS-80 2000

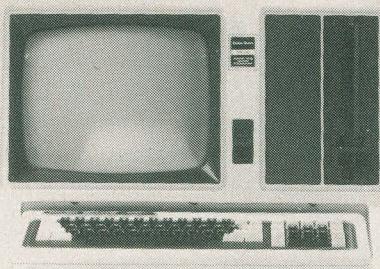

Operating System: MS-DOS
Processor(s): 80186
RAM: 128K
Printer I/O: Serial; 4 expansion slots
Disk Drives Inc.: Two slimline 5 1/4" floppy
Screen Format: 80x24
Graphics: 640x400 pixels
Sound: Yes
Colour: Yes
Keyboard: Detachable
Software Included: MS-DOS
Primary Market: Business
Manufacturer: Tandy
Available From: Radio Shack
Suggested Retail: \$4150.00 2 floppy drives;
\$6399.00 with one floppy drive and one hard drive
Other: Processor operates at 8 MHz

TRS-80 Color Computer

Operating System: BASIC
Processor(s): 6809E
RAM: 16K
Printer I/O: Serial
Disk Drives Inc.: Optional disk drives or cassette
Screen Format: 32x16
Graphics: 256x192 pixels
Sound: Yes
Colour: Yes
Keyboard: Integrated
Software Included: BASIC
Primary Market: Home
Manufacturer: Tandy
Available From: Radio Shack
Suggested Retail: \$189.95
Other: 249.95 with Extended BASIC

TRS-80 Model 12

Operating System: TRS-DOS
Processor(s): Z80
RAM: 80K
Printer I/O: Two serial and two parallel
Disk Drives Inc.: Two DS DD 8" floppy
Screen Format: 40/80x24
Graphics: 32 business graphics characters
Sound: No
Colour: No
Keyboard: Detachable
Software Included: TRS-DOS, BASIC
Primary Market: Business
Manufacturer: Tandy
Available From: Radio Shack
Suggested Retail: \$5199.00
Other: Bilingual version \$300.00 extra

TRS Model 16B

Operating System:	TRS-XENIX
Processor(s):	Z80A and MC68000
RAM:	256K
Printer I/O:	Two serial, one parallel
Disk Drives Inc.:	One 1.25 Mb 8" floppy, one 15 Mb hard
Screen Format:	80x24
Graphics:	No
Sound:	No
Colour:	No
Keyboard:	Detachable
Software Included:	TRS-XENIX
Primary Market:	Business
Manufacturer:	Tandy
Available From:	Radio Shack
Suggested Retail:	\$939.00
Other:	Multi-user capabilities

TRS-80 Model 100

Operating System:	Extended BASIC
Processor(s):	80C85
RAM:	8K
Printer I/O:	Parallel
Disk Drives Inc.:	No
Screen Format:	40 char. x 8 line LCD
Graphics:	Yes
Sound:	Yes
Colour:	No
Keyboard:	Integrated
Software Included:	N/A
Weight:	3.9 lbs.
Primary Market:	Business
Manufacturer:	Tandy
Available From:	Radio Shack
Suggested Retail:	\$799.99; 24K version \$1099.00
Other:	Built-in modem with auto-dialer

TS 1605 Personal Computer

Operating System:	TeleDOS
Processor(s):	8088
RAM:	128K
Printer I/O:	One parallel, one serial
Disk Drives Inc.:	Two slim-line DS DD 5 1/4" floppy
Screen Format:	80x25
Graphics:	640x200 pixels
Sound:	No
Colour:	Yes
Keyboard:	Detached
Software Included:	TeleDOS, TeleBASIC
Primary Market:	Business
Manufacturer:	Televideo
Available From:	Norango Computer Systems Inc.
Suggested Retail:	\$2995.00 base

UR Portabrain

Operating System:	CP/M
Processor(s):	Z80A
RAM:	64K
Printer I/O:	Two serial and parallel
Disk Drives Inc.:	5 1/4" floppy, 192K RAM disk
Screen Format:	N/A
Graphics:	N/A
Sound:	N/A
Colour:	N/A
Keyboard:	N/A
Software Included:	CP/M and Communications package
Primary Market:	Business
Manufacturer:	Universal Research
Available From:	Micro Bazaar
Suggested Retail:	\$1895.00
Other:	Portable

Winner

Operating System:	BASIC
Processor(s):	6502 and Z80A
RAM:	76K
Printer I/O:	Serial
Disk Drives Inc.:	Optional 5 1/4" floppy
Screen Format:	40/80x24
Graphics:	280x192 pixels
Sound:	Yes
Colour:	Yes
Keyboard:	Integrated
Software Included:	BASIC
Primary Market:	Business or home
Manufacturer:	Orion
Available From:	Orion Electronics
Suggested Retail:	\$995.00
Other:	Function keys; CP/M and Apple compatible

Xerox 16/8 Prof. Comp.

Operating System:	Supports CP/M-80, CP/M-86 and MS-DOS
Processor(s):	8086 and Z80A
RAM:	128K
Printer I/O:	Serial and parallel
Disk Drives Inc.:	Optional 2 floppy or 1 hard, 1 floppy
Screen Format:	80x24
Graphics:	Optional
Sound:	No
Colour:	No
Keyboard:	Detachable
Software Included:	BASIC
Primary Market:	Business
Manufacturer:	Xerox
Available From:	Xerox Stores
Suggested Retail:	\$5595.00 SS drives; \$6795.00 DS drives
Other:	\$8995.00 with rigid disk

Xerox 1810

Operating System:	CP/M
Processor(s):	Proprietary
RAM:	64K
Printer I/O:	Serial and parallel
Disk Drives Inc.:	Cassette built-in
Screen Format:	80x3
Graphics:	Yes
Sound:	Yes
Colour:	No
Keyboard:	Integrated
Software Included:	Text Editor, electronic mail
Weight:	5 lbs.
Primary Market:	Business
Manufacturer:	Xerox
Available From:	The Xerox Store
Suggested Retail:	\$2495.00
Other:	Built-in modem, clock, calendar

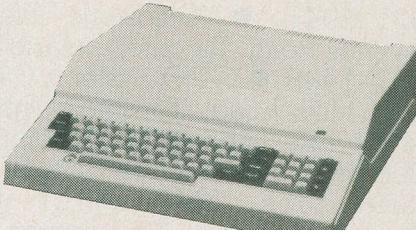

Zenith Z-100

Operating System:	Choice
Processor(s):	8088 and 8085
RAM:	128K
Printer I/O:	Two serial and one parallel
Disk Drives Inc.:	One DS DD 5 1/4" floppy
Screen Format:	80x24
Graphics:	640x225 pixels
Sound:	No
Colour:	Optional
Keyboard:	Integrated
Software Included:	CP/M or ZDOS
Primary Market:	Business
Manufacturer:	Zenith
Available From:	Local dealers
Suggested Retail:	\$4395.00 (no monitor); \$5295.00 (2 drives)
Other:	\$5450.00 with two drives and monitor

Zenith Z-160

Operating System:	MS-DOS
Processor(s):	8088
RAM:	128K
Printer I/O:	Two serial, one parallel
Disk Drives Inc.:	One or two 5 1/4" DS DD floppy
Screen Format:	80x25
Graphics:	640x200 pixels
Sound:	Yes
Colour:	Optional
Keyboard:	Detachable
Software Included:	MS-DOS, diagnostics
Primary Market:	Business
Manufacturer:	Heath/Zenith
Available From:	Heathkit-Zenith
Suggested Retail:	N/A

Zeus 2001

Operating System:	Variable
Processor(s):	6502
RAM:	64K
Printer I/O:	Optional serial or parallel
Disk Drives Inc.:	Optional 5 1/4" floppy
Screen Format:	40x24
Graphics:	280x192 pixels
Sound:	Yes
Colour:	Yes
Keyboard:	Integrated
Software Included:	Variable; user's choice
Primary Market:	Business or home
Manufacturer:	Arcomp Micro Systems
Available From:	Chez Koll Enterprises
Suggested Retail:	\$429.00
Other:	Needs system card

Computerizing the Accounts

The prospect of actually getting an accounting package and actually setting it up fills many small business owners with a nameless dread. It certainly did for us. However, after considerable swearing and hammering on the monitor we got our system running. The following are a few observations from our experience.

by Bernard Shankman
and Rod Potter

Not very long ago computerized accounting systems entailed acres of hardware and acres of cash to pay for it. The alternative... human accountants or an accountancy firm... was anything but inexpensive. It was a serious catch 22. If you had hired an accountant to tell you how much money you had paying him or her shortly meant that there was nothing left to count.

**THE TORONTO INTERNATIONAL
SOFTWARE SHOW
SEPTEMBER 20, 21, 22, 23
1984
INTERNATIONAL CENTRE,
TORONTO, CANADA**

Hundreds of software applications will be featured by manufacturers,
publishers, dealers and distributors
from all over Canada,
U.S.A. and around the world.

Seminars will be available to further show you
first hand how to obtain the best software
to meet your needs.

Also showing will be operating languages,
hard disc drives, duplicating services, user interfaces,
future trends, packaging and marketing services,
peripherals and accessories.

Plan now to attend!
Mark the dates on your calendar now!

Computerizing the Accounts

The advent of sufficiently powerful microcomputers has changed this. Not only can you buy the machines on time payments but you can get software to run on them that will do all the financial calculations involved with the loan. More to the point, a low cost computer can be made to do the work of several human accountants in many areas of the operation of a small or medium sized business.

Of course, it's not just a matter of buying a few toys and a couple of packages. Implementing an accounting package successfully... that is, so that your books aren't in worse shape than they were when you kept all your receipts in an empty Allen's apple juice can... is among the most difficult things one can undertake with a computer short of trying to understand why it doesn't work.

There is no simple solution to the problem, either... you can't just put the plug back in.

There is now an abundance of software and a host of machines to run it on. If you read a little further you'll be able to add to this some idea of just what's involved in actually marrying the two, and how best to avoid some of the more maddening traps inherent in all computerized accounts.

For Whom the BEL Tolls

There is no formula which dictates whether or not a particular business requires a computerized accounting system. In many small but growing businesses, where the owner is also the manager and accountant... and the janitor... there may well come a time when he or she simply cannot afford to spend the time required to keep the books.

When you are large enough that you don't have time to do your own books, but small enough that you can't afford to hire a full time accountant, a microcomputer system with an appropriate accounting software package may well be a viable option.

You have just read the only simple part of the whole ordeal.

The first aspect of implementing computerized accounts to consider is in finding the right accounting software. This is simply a matter of sifting through the mountain of offerings which are currently available... in much the same way that Michelangelo sculpted David by simply cutting off all the unnecessary bits of rock. There is a great deal to choose from. You will find everything from ultra-specialised packages for retail florists to large, general accounting systems which interface with payroll, inventory and financial spreadsheet programs.

The advantage of a general software Dimensions and the Hardisk Accounting

Series by Great Plains are designed modularly. This does more than just impress the help. A modular design allows one to implement the separate functions of a general accounting package separately... rather than having at the whole chaotic transition from human to computerized accounts in one bash... as well as permitting one or more of the functions to be omitted if it isn't required.

The Accounting Plus package, for example, consists of seven modules. The general ledger module is the heart of the system. It keeps track of current financial information as well as prior year and budget information. It will also organise information from the other modules and produce financial statements.

You may have to repeat this procedure several hundred or several thousand times depending upon the current thickness of your manual ledgers.

The other modules include accounts payable, accounts receivable, inventory control, purchase order, sales order and payroll. The beauty of the system is that apart from the general ledger you need buy only the modules that you will use.

From a logistical point of view, the acquisition of an accounting system involves several steps. When the software has arrived and is plugged into the system, all assets, liabilities and other numbers accountants love to talk about must be entered by keyboard into the system.

For the average business... unless you are starting your company and your computerized accounts system simultaneously... this will represent a huge amount of work. If you are operating a medium sized business with moderately complex accounting procedures you may find that you need a full time employee just to key in the initial backlog of data.

Down To It

As a practical real world example of using an accounting package, the Accounting Plus package allows the user to organise and store thirteen different types of accounts in the general ledger. Each account is given a number. Using the software manuals and the screen prompts, it is a simple matter to set up the general ledger accounts. You are asked to enter the account number you have chosen, an account description and the account type. You are then asked if you want to accept, edit or delete what you have just typed.

It is useful to organise the accounts so that the first digit in the account number identifies the type of account. Assets can be assigned numbers in the thousands, expenses in the two thousands, sales in the three thousands, and so on.

The procedure is similar for other modules. In the accounts receivable module you can enter customer names, addresses and phone numbers as well as the amounts of credit limits, current orders, current accounts receivable and the payment due date.

It all sounds fairly straightforward... and it is, except that you may have to repeat this procedure several hundred or several thousand times depending upon the current thickness of your manual ledgers.

You would think that once the system is up and running you could simply file the old ledgers in some dusty corner, to be forgotten by everyone but the auditor. However, during the first two or three months of operation the books should be balanced manually as well as by computer. This will allow the operator to check for data errors, program bugs and to generally get used to the system.

There are a number of things to get used to. A computerized accounting system operates by balancing a basic accounting equation. The basic equation says that assets equal liabilities plus capital. To make this equation balance, any increase in assets must be accompanied by an increase in liabilities or capital. What this means for the user is that all entries must be entered twice.

Not surprisingly, this type of bookkeeping is known as *double entry* accounting. With this type of accounting system, the system will be, and essentially demands to be, balanced at all times. This allows the user to extract a balance sheet, an income statement or a trial balance from the computer at any time. The ability to generate financial reports quickly and accurately gives the user a greater ability to project growth patterns and make informed business decisions.

Where the Money Goes

The owner of a small business will be able to see where the money goes, where it comes from and how much gets lost or wasted in transit.

By creating accounts for such demons as sales adjustments and the cost of goods sold, the business manager can generate reports which detail the costs and benefits of particular facets of his or her business. With a sales adjustments account all returns of merchandise will be recorded and can be reported. If a refund or rebate is given to a customer because of a company mistake, that amount will also be recorded.

Suppose, for example, a customer buys one hundred wotsits at one dollar each. Sometime thereafter the customer discovers that twenty of the wotsits are defective and returns them. Using a manual accounting system you would probably just send the customer an invoice for eighty dollars for eighty wotsits.

With a computer accounting system such as *Accounting Plus*, the twenty dollar adjustment must be recorded. This will eliminate any discrepancy between the amounts entered in the sales account and the amounts actually invoiced.

With the ability to create a report outlining all sales adjustments the business manager will be able to identify and correct many sales and manufacturing problems. However, inherent in this ability is the requirement of the system to have on hand *all* the pertinent data. There is only one way for it to get this... if you're looking at your fingers right now you've guessed right. Accounting software, unlike human beings, cannot extrapolate, fudge missing data or overlook sloppy transactions.

Think of it as a crotchety old man with patience about as long as your thumb nail.

Using the accounts receivable module, the user can generate invoices with a minimal amount of pain and frustration. Since all sales transactions and customer particulars are already stored, it is a relatively simple operation to get invoices printed and mailed on time. Not only can the computer churn them out much faster than humans, it can also print reminders, messages and greetings.

The Safe

As with manual accounting systems, computerized systems can be vulnerable to accidental or malicious tampering and damage. These risks can be greatly reduced with appropriate security measures.

Any accounts package worth its salt will have a password to protect it. If you know the password you can run the software. The

password should be changed regularly to make things difficult for a would be saboteur.

While you can't stop a really determined and knowledgeable pirate from getting at your data... any more than you could stop him or her from gaining access to a manual ledger, even if it were to be locked in a desk... most situations don't call for quite this much paranoia. Unless you run an unusually unruly company, you will probably be a lot more concerned with casual tinkering. A password will generally stop this.

Just as important is the necessity of duplicating all important data and storing it in different locations. A weekly and monthly routine of backing up your disks must be adhered to religiously. It will probably be reassuring to know that if business becomes the victim of a fire, a theft or even a local meteor shower you will still be able to reconstruct your records. Keep in mind that the data on a computer disk is considerably more volatile than that kept on paper.

Choosing a computer to run your software on is not nearly so difficult as choosing the software itself. However, if you are fairly new to all of this you may find that there are a number of traps lurking in your corner computer shop... most of them set to spring long after your cheque has cleared and been assimilated by someone else's accounting program.

There are some obvious things one can say about hardware. First of all, you should choose the software you want and then get a computer to run it on. Most of the more powerful accounting systems for medium sized businesses available at the moment run under IBM compatible computers. You'll probably need a hard disk... thus, you'll be after an IBM XT or something similar.

In choosing your computer you can pop for a genuine system... in this case, an authentic IBM. Reality, however, is always the most expensive approach. Compatibles come in all shapes... and prices... from there on down, and what you get will be largely a matter of common sense. You have to trade off the cost of the computer against your potential situation should the thing decide to die... with all your records locked within.

Just like a human accountant, occasionally your system may get sick. It could be a bug in the program... yes, they crop up in even the most expensive packages... a hardware breakdown or both. It goes without saying that an imported system built and distributed on a remote atoll in the South Pacific will probably not have a reputation for prompt service... at least not

in this hemisphere.

The initial cost and time required to implement a computerized accounting system may seem quite high... needless to say it will all pay for itself over a few months, especially if you've been sitting up night labouring over your books. Furthermore, although most employees initially resent the intrusion of a computer in time you'll probably find that they'll grow to appreciate the machine. With increased productivity and the elimination of a great deal of mathematical drudgery you will probably experience a more cordial and civilized office atmosphere.

Furthermore, when the printer has finally stopped chattering and everyone has gone back to doing other things... you can play Zaxxon on the system. Now there's a good reason to buy a computer. **CN!**

TRS-80 Model II MDM730

If you're using a TRS-80 Model II system under one of the popular CP/M implementations for this powerful machine you'll probably know how nearly impossible it is to get telecommunications software patched for your computer.

There's a good reason for this... the serial I/O facilities of the Model II are weird.

To battle the evil of this awesome negativity, we have created an MDM730 overlay for the Model II which allows users to enjoy the full power of MDM730... plus a few enhancements.

MDM730 is the most powerful CP/M based terminal package available, replete with features too numerous to mention here. For a more detailed description of its capabilities, please see the MDM730 article in the August issue of Computing Now!

This implementation of MDM730 will operate under either Lifeboat or Pickles and Trout CP/M. A selection of MDM utilities is also provided with the disk.

The cost is only **\$29.95**

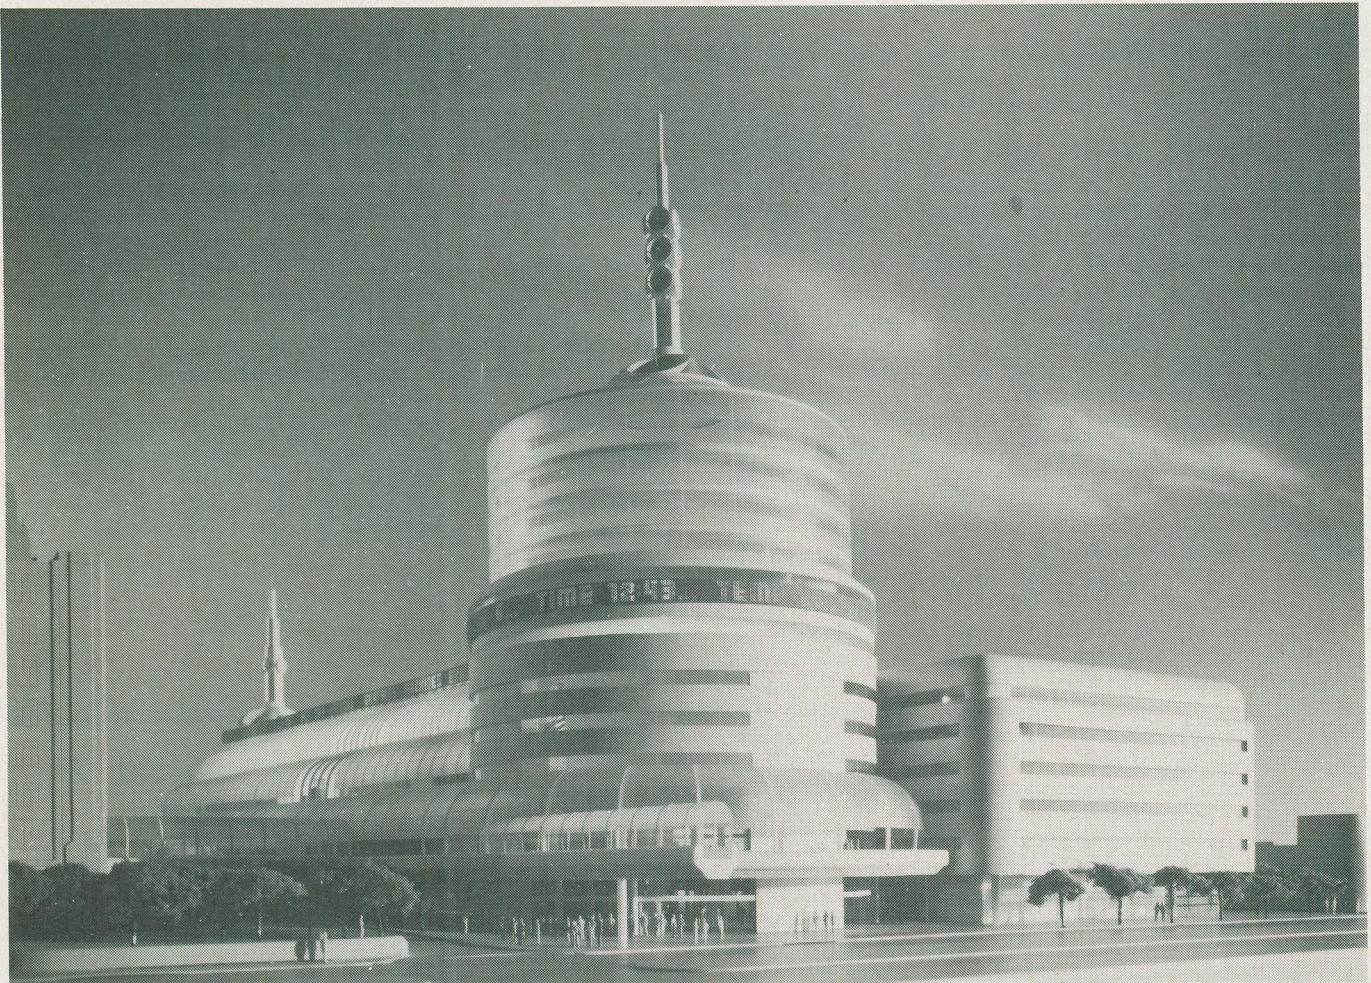

**Computing Now! Software
25 Overlea Boulevard, Suite 601
Toronto, Ontario M4H 1B1**

Fine Print:

The MDM730 program is available in the public domain, and is offered here free of charge. The charges for this package are for the overlay code generated by Computing Now! and to defer the cost of postage, handling and the medium.

The TRS-80 Model II MDM730 code will be ready to run when you receive it. Moorshead Publications warrants that it will function properly if correctly applied.

Computer Museum

You may well wonder why a technology that's barely old enough to have expired warranties needs a museum. Well, in computer time it took you about three hundred years to read this introduction. We must preserve the past before it's lost to us forever.

by Frank Lenk

What is long, low, rounded futuristically, and covered with glass? What looks like the submarine Seaview washed up on shore? It's... it's...

The Computer Museum of Canada.

Gets you real excited, that, doesn't it... Oh, well, yes, the name could stand to be peppier. Actually, it came close to be something like "Computerium", which perhaps reflects the function of the thing a bit better. However by any name it's a fairly entertaining idea and a really innovative project from one of Canada's youngest computer millionaires.

Abe Schwartz is a co-founder of Polaris Technology of Toronto, a company that

started in 1977 on five thousand in borrowed bucks. In August of last year, at the ripe old age of twenty-five, Schwartz sold Polaris to the ballooning CrownTel empire for ten million dollars...count the zeroes. Schwartz is still president and chief executive officer for Polaris, which now employs about a hundred people. The computer museum is a concept he hatched in his copious spare time.

The Museum was officially launched at an impressively lavish press conference early in June.

Anchors Aweigh

"The Computer Museum will be the largest museum in the world dedicated to the

display of computer technology," claims Schwartz. The general idea behind it all is to make Canadians more comfortable with technology and its implications. However, Schwartz has, as an initial task, making Canadians comfortable with the idea of a computer museum.

Obviously not one to plan for failure, Schwartz has given his brainchild a running start. The initial press conference was passingly spectacular. The members of the press were greeted by thick dossiers of notes, architects' drawings and glossy photos. A model of the proposed building filled one corner of a room. A computer graphic film strip... from the people who did the computer screen displays in Star Trek III, no

less... helped put everyone in a receptive mood.

Schwartz plans to have funding together by next spring and the Museum ready to open its doors sometime in the middle of 1986. The proposed price tag is some twelve million dollars. Most of this paltry sum is to be solicited from the computer industry. Schwartz wasn't saying how much he's sunk in the project so far, but admitted that it was "in six figures".

The contents of this electronic crystal palace are only partially hinted at by its somewhat mundane sounding title.

There will, of course, be an actual computer museum in there somewhere. That is, there will be exhibits dedicated to tracing the history of the development of computer technology. To put this in perspective, the total exhibit space is planned at forty-five thousand square feet, or about a quarter of the size of the Ontario Science Centre. A third of this "will be devoted to displaying and explaining technology", according to Schwartz. "The rest will be used for the demonstration of computer applications."

The museum will naturally try to highlight Canadian computer accomplishments. It will also attempt to point up some of the social issues relating to computerization. Reference materials, both printed and electronic, will be assembled for public access.

A one thousand seat auditorium will be made available for "the exchange of ideas". Furthermore, a number of smaller meeting rooms will be made available to groups "wishing to meet on technology related issues." These groups will include scientific, professional, educational and business associations. Also included will be clubs, interest groups and that sort of less serious phenomena.

Several types of exhibits are being envisioned for the display areas. "Imagine if you will..." says Schwartz.

Imagine a room sized mock up of a microprocessor chip that you can walk through. There will be robots and computer controlled equipment that visitors can operate and program. And, of course, there will be computers. Envisage a room full of terminals on which visitors can "explore the typical types of software currently being used." Those "still too timid to approach the terminals"... and those squeezed out by the crush... will be able to watch the action on large projection screens.

An entire annex of the Museum building will be dedicated to computer art.

The building design is also a part of the display. A creation of the Matsui Baer Vanstone Freeman architectural firm, the

museum building is intended to be "a model for the new generation of intelligent buildings". This means that all of its energy, security, internal communications and office automation will be run by a central computer complex. A scrolling display will encircle the building, announcing museum ac-

tivities. Each of the exhibits inside will also be monitored by the computer to measure its popularity.

Reality

Schwartz has already assembled an impressive roster of personalities to be the top

Macintosh™

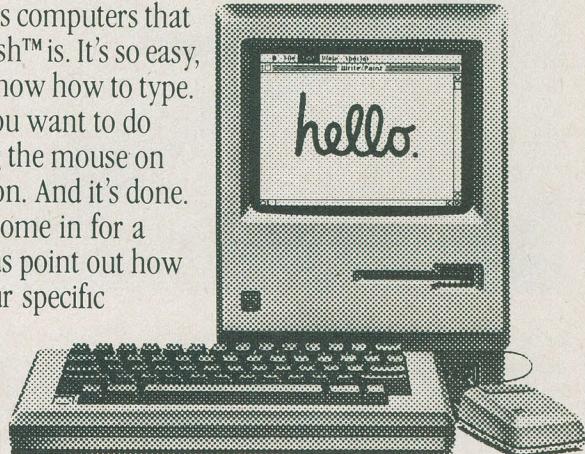

If you can point,
you can
use it.

Unlike other business computers that claim to be easy, Macintosh™ is. It's so easy, you don't even have to know how to type.

Just point at what you want to do on the screen by moving the mouse on your desk. Click the button. And it's done.

See it for yourself. Come in for a demonstration. And let us point out how Macintosh can solve your specific business problems.

Apple and the Apple logo are registered trademarks of Apple Computer, Inc. Macintosh is a trademark licensed to Apple Computer, Inc.

Computer Museum

brass of the museum. This select group includes Senator Keith Davey, Richard Rohmer, the well known author and chancellor of the University of Windsor, Professor J.W. Graham, the director of computer systems at the University of Waterloo, H. Ian Macdonald, the president of York University and of Idea Corporation, Jim Miller, the publisher of Maclean's magazine and others. Schwartz himself will act as the president of the museum.

According to Schwartz, the response from the computer industry in the course of "unofficial talks" thus far has been encouraging. Most of the needed cash should come from within the Canadian computer in-

dstry, the faction with the most to gain from promoting the technology. Government funding would only be sought as a last resort.

The other major hurdle is the problem of where to put the thing. The most promising location so far is in Toronto's Harborfront development. The long, narrow museum building could fit nicely between the existing York Quay Centre and Queen's Quay terminal buildings.

The location is not settled yet. However, negotiations are far enough along that all of the architects' drawings and models were based on Harborfront.

A lot of details also need working out,

not the least of which is the question of whether or not Toronto is willing to be convinced it really needs a Computer Museum. If the Museum is to be built, there is the question of what place it will take among all the other institutions, such as Harborfront, the Ontario Science Centre and other museums. If the Museum is built at Harborfront one can also consider how will it relate to Harborfront's already successful computer centre. Perhaps most important, how much will it cost to get in?

Schwartz maintains that it will not be more than two bucks.

See you at the grand opening.

COMPUTER PRESS

Free PCjr Upgrade

TORONTO, ONTARIO — *IBM Canada Limited* has designed a true typewriter-style keyboard for its PCjr model, and is making it available free of charge to current PCjr owners. The new keyboard, also operating by cordless infrared link, has 62 contoured full-travel keys with a standard typewriter-like layout, appearance and touch. This keyboard is now standard on all PCjr systems.

As options, IBM has also introduced 128K memory expansion attachments, a power expansion attachment and a speech synthesizer for the PCjr as well. Using the power expansion unit, up to three 128K attachments may be implemented to provide a maximum of 512K user RAM. The memory attachments are complemented with RAM-disk software.

Professional Computer

TORONTO, ONTARIO — *Datapoint Canada* has announced a new professional computer for the business environment. The Vista PC is based on the 80186 16-bit microprocessor, and includes 256K of RAM. A high-resolution colour monitor is stan-

dard, and complements the 720 by 348 pixel graphics the computer is capable of.

The Vista PC, manufactured by Convergent Technologies, Inc., can run MS-DOS, has windowing capabilities and can be used alone or in a networking environment.

Interested parties can contact Datapoint Canada at 4881 Yonge Street, Suite 700, Willowdale, Ontario M2N 5X3 or call (416) 222-8005.

VisiCalc Rebundling

NEW YORK, NEW YORK — *Software Arts* has made extensive enhancements to VisiCalc and VisiCalc Advanced Version and is now offering both programs together as the **VisiCalc Package**. Dealers with older versions of the two programs for the Apple //e and III computers will be able to exchange them without extra cost for the two-in-one spreadsheet package.

The VisiCalc Package is available to Apple //e and //c users, supports both DOS 3.3 and ProDOS, and contains *The VisiCalc Book* for added program reference.

Features added to VisiCalc include full word prompts and variable column widths. The VisiCalc disk also includes six home management and finance models. Enhancements to VisiCalc Advanced Version include an on-line introductory guide, context-sensitive help, one-key macros, varied single cell formatting, variable column widths and date functions. Both programs support either 40 or 80 column displays.

Apple //e users can run either program in the package. Apple //c users will require an external second drive to implement VisiCalc Advanced Version.

Tennis, Anyone?

OAKLAND, CALIFORNIA — **Martina Navratilova**, the undisputed number one ranked women's tennis player in the world, has signed a service contract with *ComputerLand Corporation*.

The agreement calls for Martina to wear a ComputerLand patch on her sleeve, film 30-second 'tennis tips' for company commercials and appear in point-of-purchase advertising. The contract guarantees her appearance in the ComputerLand U.S. Women's Indoor Tennis Championships.

Next Month In Computing Now!

BDOS in BASIC

Powerful as it may be, there are a number of things that you simply can't do in Microsoft BASIC due to a lack of low level system control. There is a way around this, however . . . it involves using machine language imbedded in BASIC programs. Next month we'll look at a startlingly painless way of doing this and a complete implementation of system calls in BASIC.

Directory of Computer Stores

Yes, it's one of the most powerful three phase semi-automatic catalog management software packages available . . . but you still don't know where to actually acquire a copy of it. You need the Computing Now! directory of computer stores. This exhaustive list, updated constantly, will tell you where your local micro dealer is even if your local is Glace Bay.

Across the Pond

One of our number recently returned from an extended trip to Britain with news of the computer scene over there. It's really interesting . . . and very much different from the way things have evolved here. There's a mass of interest in low end systems and games software . . . and very little in business computing. We'll look at the complete tale next month.

Otronix Reviewed

The Otronix 2001 personal computer looks like it has been designed for use by really fierce executives . . . or Conan the barbarian. It can pretend to be an IBM compatible . . . or it can be something unique and all of its own. It's sort of portable in the same way that a house isn't and is unusually interesting to play with even if you can't find the power switch. The whole beach party happens in thirty days.

Also coming in October
Software Now's
First Edition

*Hayes. Leading the way
with quality telecomputing
systems for the personal
computers that businesses
use most.*

When it comes to communicating—computer to computer—Hayes says it best. All you need is a Hayes Smartmodem (it's like a telephone for your computer) and Smartcom II® software, to get you into all the right places.

In no time at all, and with no assistance at all, you can create, send and store files, and automatically log on to information services. The communication possibilities are endless!

*Introducing our new Smartcom II.
More connection capabilities.
More convenience.*

Now Hayes goes even further to streamline your communications and optimize your connections.

Smartcom II software is currently available for more than 16 personal computers (with even more to come). That means you can communicate,

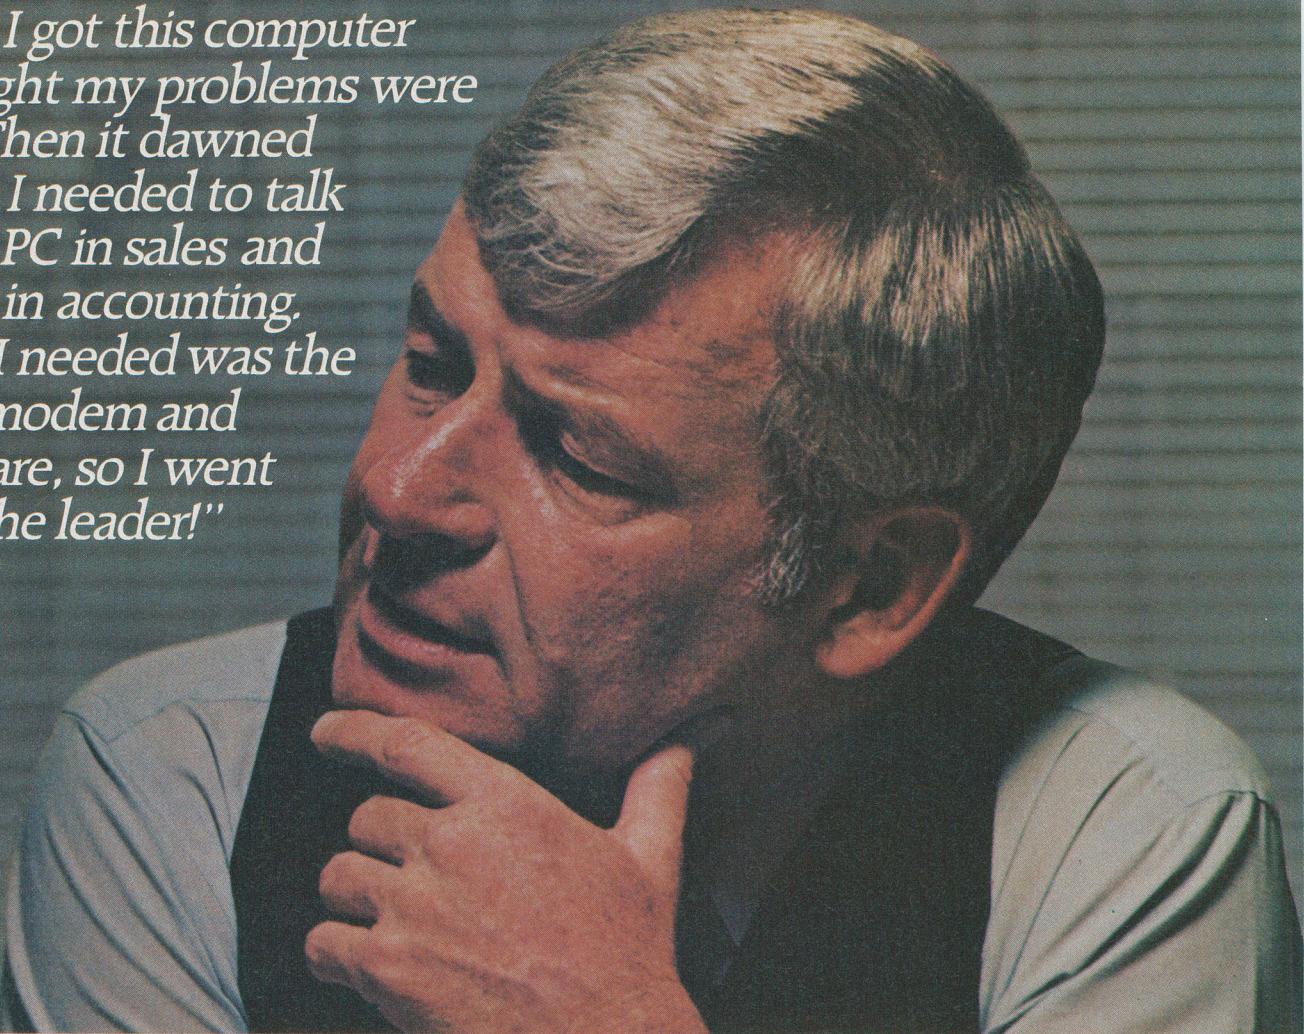

Smartcom to Smartcom, with an IBM PC, DEC Rainbow 100, HP 150, TI Professional Computer* and others.

And that's not all! Smartcom II also emulates the DEC VT100 and VT52 terminals, now in widespread use in many businesses. This feature lets your personal computer "pretend" it's a DEC terminal, opening the door to a vast installed base of DEC minicomputers!

We stand on protocol.

In addition to the popular Hayes Verification protocol, the new Smartcom II also includes the XMODEM protocol, ensuring accurate transmission to a wide range of personal computers and mainframes at information services. By matching the protocol (or "language") of a remote computer to yours, Smartcom II can transmit information error-free, regardless of interference on the phone lines.

*"When I got this computer
I thought my problems were
over. Then it dawned
on me I needed to talk
to the PC in sales and
the TI in accounting.
What I needed was the
right modem and
software, so I went
with the leader!"*

Voice to data—in the same call!

With Smartcom II, you can easily switch from voice to data transmission (and back again), all in the same phone call. This saves you time and money, since you don't have to hang up and dial again.

**Your Hayes telecomputing system
works—totally unattended.**

Smartcom II makes telecomputing simple, even when you're not there. It allows your Smartmodem to receive a message for you when you're out, and leave it on your disk or printer. And you can tell Smartcom II to "save" the messages you've created during the day, and automatically send them at night, when phone rates are lowest.

Get your hands on the leader.

With an unsurpassed record of reliability, it's a small wonder Smartmodem

is such a smart buy! Smartmodem 300™ (the first of the Smartmodem series) dials, answers and disconnects calls automatically. Smartmodem 1200™ and Smartmodem 1200B™ (it plugs into an expansion slot inside an IBM PC or compatible), provide high-speed, high-performance communications for businesses of all sizes.

And when Smartmodem is purchased with Smartcom II, you have the most dependable telecomputing system available for your personal computer.

Everything we do at Hayes is designed to make communications easier for you. Feature-rich, direct-connect modems. Menu-driven software. Concise documentation. And a customer service organization, second to none!

See your dealer right now for a hands-on demonstration of Smartmodem and our latest version of Smartcom II. From the telecomputing leader. Hayes.

Hayes Microcomputer Products (Canada), Ltd.
Customer Service Center, 5955 Airport Rd., Suite
200, Mississauga, Ont. L4V 1R9. 416/283-2627.

Sight and Sound for the Apple

The owners of Apple compatible systems have access to the largest assortment of hardware accessories going, turning the computer into everything from a word processor to a Hammond B3 organ. Here's a look at two shiny brand new ones.

by Steve Rimmer

After laying awash in the doldrums of technological mediocrity for some time the Apple seems to be once again experiencing a rebirth of interest on the part of some fairly innovative designers. For almost half a year now the producers of Apple compatible peripherals have been patiently emanating newer and better printer interfaces, RAM disks and all manner of other really boring fiberglass. If another new disk drive controller so much as shows its face in my office I'll plug it in

with the power on and play Grateful Dead music while it sizzles.

However, just recently there seems to have been a bit of life on the horizon. Several manufacturers appear to have simultaneously pushed the pen up buttons on their CAD plotters and emerged with some really lively hardware. This is good stuff, toys to displace lesser cards and give the Apple still more immense capabilities than it could ever have imagined. Of course, this doesn't take much... it's hard to

program a lot of imagination into forty-eight K of memory.

This month we're going to look at two new highly brilliant accessories for the ubiquitous fruit. Far from being mundane, these things fairly hum with interesting activities... one of them quite literally so, in stereo. They will blast your fruit far beyond the range of being a mere video game or word processor.

Yank them tops off, me buckos...

Classic Music Machine

Not surprisingly, Classic Organs builds organs. You've probably never heard of them because for the most part the organs that roll out of their secluded Markham industrial park suite wind up in churches rather than under synthesizers for a good jam.

Classic Organ is a really hot name in liturgical music, though... which may not begin to explain why they've gotten into their most recent departure from the mainstream rock of ages sound.

The *Classic* is an organ type keyboard that plugs into an Apple and, along with a set of music cards, turns the otherwise nearly mute fruit into one of the most profound keyboard instruments available. About as far removed from control G bleep as one can be without a warp drive, the *Classic* music system features sixteen fully programmable voices, tune recording and editing, multi tracking and other stuff too amazing to even consider right at the beginning of an article.

For a number of reasons, it's the most flexible and the most playable music system available for an Apple II+.

Addagio

Popping a keyboard into your Apple and wailing is not a wholly new experience. There are, in fact, two popular music systems available, these being the *Alpha Syntauri*, from Syntauri Corporation, and the *Soundchaser*, from Passport. Both are pretty decent machines. However, insofar as the serious keyboard banger is concerned, both have limitations which make them less than ideal instruments.

The first of these is simply that they are mutually incompatible. Both packages have strengths and weaknesses which complement each other... but you gotta buy 'em both to get the whole talking elephant act under one tent. Neither is cheap.

Secondly, both of these systems are besieged with the curse of the barbarian sixteenth century hammer touch keyboard. They feel suspiciously like Pratt Reeds, although it would be hard to tell without ripping one apart, something they won't let you do down at the music store.

The keyboards don't seem bad if all you're used to playing on is either a typewriter or a ninety-nine dollar chord organ from Woolco. However, once you get fairly decent at it all they're a downer... their action is very much opposed to light, fast movement. This is a drag, as it keeps an otherwise flexible instrument from being nearly as as much of a ride as it could be.

The *Classic* system is built around finer

stuff. To begin with, it is will run nicely with software supplied by either of the two existing computer synthesizer system manufacturers... we'll get to all that presently. It's also based on some really superb keyboards which the lads at *Classic* came up with in Italy.

The Italians largely invented keyboards and, as such, have had quite a while to get them right.

With the advent of really nice keys the *Classic* system is a mind blastingly flexible thing. We're only going to be able to look at some of the gyrations you can perform with it... this overview should serve however, to give you some idea of the possibilities of the whole works.

Alpha Waves

In overview... at least at the level we're going to discuss them at... both the *Alpha Syntauri* and *Soundchaser* software packages are essentially similar. Both have positive features when you get deep enough into them, but either will serve to illustrate the power of the *Classic* hardware.

As I noted above, you can have both of them if you want to. We're going to look at the *Alpha Syntauri* package... largely because it was the first one I opened when I tried this thing.

To be fair, the *Alpha* also comes with better tunes. Some of the canned music that accompanies the demonstration software is superb for being cruel to. Ever head Pachelbel's Kanon played by a forty piece saxophone orchestra like jazz? The graves of Baroque composers all across Europe are emanating a strange unearthly shrieking sound even as you read this.

The largest problem with the *Alpha* package is knowing where to start describing it. It's somewhat massive. Probably the most sophisticated of its many appendages is something called *Metatrak*... a kind of piano player in a five and a quarter inch black square.

Like all of the *Alpha* software, *Metatrak* is configured for whatever way you happened to stick the cards into your system. The software will be looking for the existence of a minimum of five cards in the Apple, to wit, a language card in slot zero, a disk drive controller in slot six... it doesn't have to be there but it always is... the *Classic* keyboard controller card in any slot you like and the two Mountain sound cards... we'll get to them presently... in any two consecutive slots of those remaining.

The *Soundchaser* software isn't nearly that flexible... it wants the keyboard in slot seven and the sound cards in four and five. Inasmuch as the *Classic* system can handle

both systems this would be the logical place to put the cards.

When you first boot up *Metatrak* it makes a number of choices on your behalf. The first one involves its loading a set of ten *presets*. A preset is a sound, essentially one digitized cycle of the waveform that will eventually make it out of your speakers when all this is over with. The ten presets are a variety of voices which you can play through the organ keyboard. Included are some fairly decent ones, such as bells and organ sounds, plus a number of pretty spacy ones, like outer space noises and car horns.

Bach does not play well in car horns.

The *presets* live in files. You can create your own through a number of means provided by utilities incorporated into the system. Files can be altered after their creation, so you can put together files of your favourite instruments. The files load quite quickly, and, thereafter you have ten instruments on tap at any one time. A preset is activated by hitting the appropriate number from zero to nine of the Apple's keyboard. That's the QWERTY keyboard, that nasty one with the letters on the keys.

If you're new to all this musical stuff you may wish for letters on the keys of the other one too. Sadly, they don't come that way.

Having selected a preset or, failing this, allowing the system to default to "bells and feedback", its pet noise, you can play something on the organ keyboard. Sound will emerge from your speakers if your amp works and all will be well. It's hard to describe the realism of the sounds you can get out of one of these things except to say that if you like genuine pipe organs, brass, pianos and suchlike you'll get into this thing every bit as much.

The only difference between a recording of a pipe organ played through one's sound system and the *Classic* system played through the same sound system is that the record probably cost about ten bucks and the *Classic* system rather more. On the other hand, you can't suddenly decide you want the organ on the record to become a heavy metal band.

When you play music on the *Classic* keyboard running *Metatrak* the screen produces this... display. It's highly weird and well recommended for anyone who likes coloured lights. You get these little glowing boxes on the tube that dance around in relation to the keys that are down at the moment. It looks like the last part of Close Encounters.

This Month in Electronics Today

Radio: What's Happening

Our special feature this month updates you on what's been happening in broadcast, shortwave, and telecommunications radio. AM Stereo, for instance, looks at the trend to improving the sonic quality of AM broadcasting; on a listening test, we couldn't distinguish AM from FM.

Interested in long-distance reception? Our DX article takes a tour of distant stations with nothing more than a standard AM radio.

Cellular telephones are the coming gadget; multiple broadcast sites controlled by computer means the possibility of low-cost, reliable phones in any car.

Commercial shortwave is rarely mentioned; we look at some of the stations broadcasting in Canada, as well as some of the amazing receivers available.

Metronome Project

Having trouble with tricky rhythms? Accent the beat with our Offbeat Metronome and the mysteries of notation are a little less intimidating.

Direct Broadcast Satellites

Roger Allan reports on the pros and cons of having a satellite network broadcasting directly to homes without the need for huge dish antennas.

Audio Test Set Project

Reduce workbench clutter (and cost) with our signal generator and amplifier all in one.

The RS232 Explained

Your computer probably has an RS232 port for talking to other computers. Here's how it works.

Apple ProDOS

After the advent of the Macintosh and 2c, it was only natural for Apple to upgrade the DOS 3.3 operating system. Here's a look at how it works.

**ON NEWSSTANDS
ACROSS
CANADA NOW.**

Classic Music Machine

More Noises

In addition to preset waveforms you can also have preset envelopes... sound dynamics specifications... to mix and match. In addition you can add slow periodic phenomena like tremolo. In short, the system can do all the things a sophisticated analog synthesizer can manage but with about a zillion times more control and flexibility in about a hundredth of the time.

Once you get over all the possibilities of Metatrak in what turns out to be its dumbest mode, you can get into some of its other tricks. The simplest of these is the capacity for splitting the keyboard.

Table 1

The Classic system needs a set of Mountain Music cards or something that will do the same thing. Classic makes Mountain compatible cards which use different technology to make the same noises with... as opposed to some of the clone cards around. Also unlike most of the clone cards, these work. They cost \$295.00 per set.

A keyboard... without the case... is \$325 or \$350 for one with velocity sensing contacts. You can get the basic keyboard in kit form for \$195. An oak case is \$140.

The interface card for the keyboard... the thing that plugs into the Apple... is \$95. This supports both Soundchaser and Alpha Syntauri software.

The whole shooting match all put together and ready to rip is \$795.

Classic Organ can be found at 300 Don Park Road, Unit 12, Markham Ontario L3R 3A1 1-416-475-1263.

Passport Designs Incorporated, which does the Soundchaser, can be reached at 116 North Cabrillo Highway, Half Moon Bay, California 94019 1-415-726-0280.

Syntauri Corporation lives at 4962 El Camino Real, Suite 112, Los Altos, California 94022.

In order to be able to play really complex sounding stuff all by yourself it's often desirable to do the left hand stuff and the right hand stuff in different instrument voices. The Metatrak package allows one to split the keyboard up to eight ways... although, for most things, anything more than three splits gets a bit unwieldy. Each split can then be assigned its own preset.

Split setups can be saved in files and loaded quickly upon later playings.

The most outrageous part of Metatrak, however, is the ability of the system to pretend it's a sixteen track tape recorder... hence the name, I suppose. The system has a number of screens and displays to present various parameters of a multi track recording in proper computer lights and letters

and, when you get your head around it all... it takes a few days... you can manipulate it exactly like a sixteen track reel to reel, including being able to dub and punch in each track whenever the inspiration zaps you and, finally, to be able to mix the whole mess down to stereo for preservation on a cassette or playing through a regular sound system.

Of course, using the Metatrak to handle multi track recordings is, not surprisingly, rather more flexible than using physical tape. You have note by note control over things and all the flexibility of the system in general. The only fundamental limitation is that the music hardware limits one to having sixteen voices, in addition to the sixteen track restriction... that is, sixteen sounds happening at any one time.

Coda

The Classic system really blows away the last limitations of Apple sound. It's well crafted... in Canada, of course... and transcends the hardware limitations of the other systems which, one suspects, deliberately incompatible with each other.

In order to get one of these things together one needs a fair bit of aggregate stuff in the same general space. To begin with, you'll want a forty-eight K Apple compatible system and a stereo amplifier.

The Alpha package requires a sixteen K memory card. The Soundchaser insists on being able to use slots four, five and seven... if you have an enhanced clone make sure that you can manage at least one of these requirements.

The occasionally referred to sound cards are, in fact, Mountain Music boards, a pair of fiberglass jokers that join at the top through a connector and live in consecutive slots. You gotta have these things in some form for the system to make any noise.

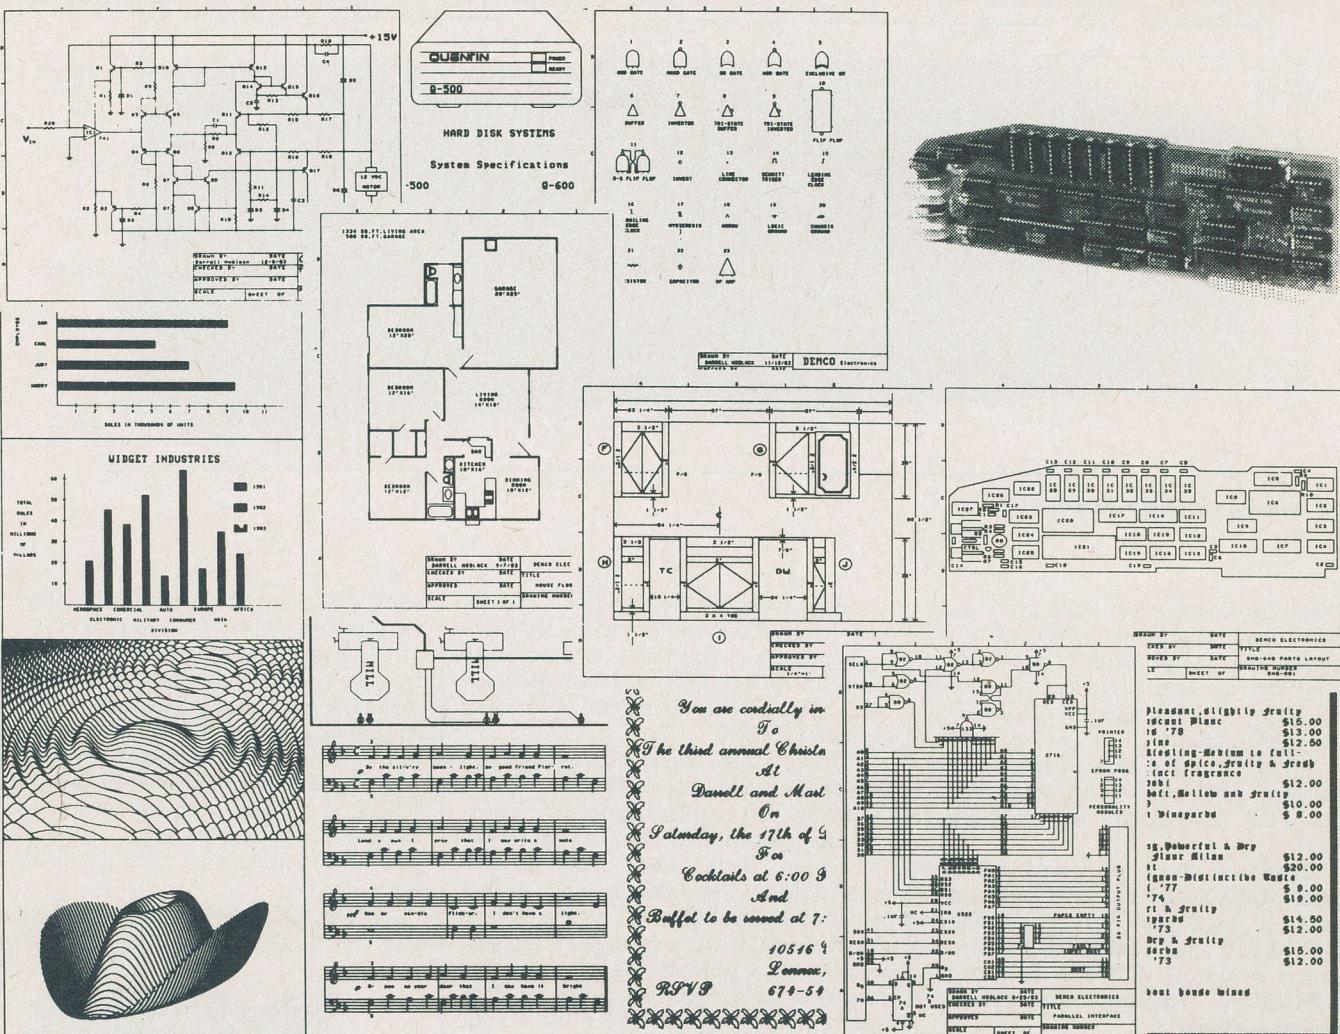

Finally, there is the keyboard and interface.

The other component of this party is the software. While Classic is working on software of its own, they do not sell any software with the system at the moment. However, both the Alpha Syntauri package and the Soundchaser software are available from their respective manufacturers directly. You can choose which one you'd rather go with.

The Classic sound system is right up there with the Micron Eye and the Koala pad on my list of splendid things to connect to a fruit. It's well built, reasonably inexpensive and flexible.

Get one and wail.

Graphics Tool Kit Review

The Apple's inherent forty column screen has always been among its most tedious stumbling blocks. Plugging a Videx card, or other eighty column device, into the system renders its display in a more professional format... but only at the expense of forgoing all manner of high resolution graphics while one is looking at the longer lines.

The Graphics Toolkit is a card and some software which implements an extremely high resolution display for the Apple. It gives rise to the Canadian Tire theorem of computer development... if the old clunker hangs around long enough all its parts will be replaced. Without any imagination at all... given a decent enough monitor to show the thing though... you can boot this monster up and pretend you're looking at a Macintosh.

This illusion is further enhanced by the availability of a version of this package which supports a mouse.

The display provided by the Toolkit card is about as sharp and solid as one can envisage a video screen being, rendering six hundred and forty dots horizontally by three hundred and eighty-four vertically. By comparison, the screen of a Macintosh can present a mere five hundred and twelve by three hundred and forty-two pixels.

Based on a 68A45 cathode ray tube controller... the same type of chip used in the Videx card... the Toolkit's works have been seriously thought about and contain a number of really decent features. For example, the card has a built-in soft switch. You plug the output of your fruit into the card and the output of the card into your tube. When the card is supposed to be doing something it makes the monitor take its signal from the high resolution display generator. At other times you can look at the normal forty column display.

The software included with the package... we'll get to what it can do in a

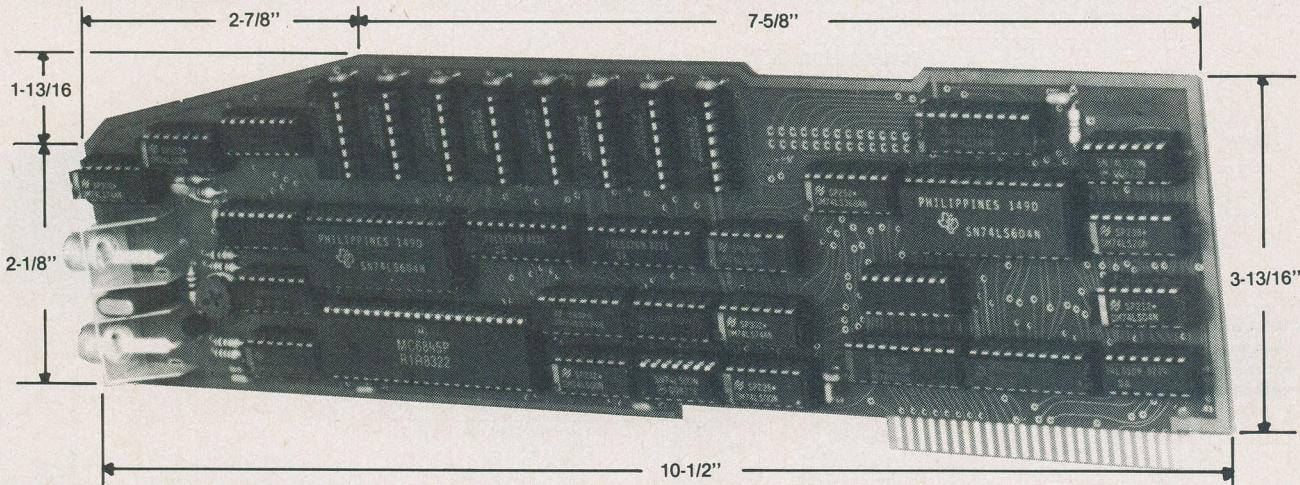

bit... supports not only the graphics but also a selection of printers and interfaces. The whole dog and pony show is listed in table one. Having a printer is essential to properly appreciate the profound party this thing can be... it can dump high resolution images to hard copy, you see.

Sharp and Nasty

The simplest way to use the Toolkit card is to run it from Applesoft. Upon booting the supplied software the system will install about two K worth of hardware drivers which make several changes to Applesoft's high resolution routines. Having gotten this together you can use all of the usual high resolution commands normally supplied under the language plus a few new ones.

To begin with, things like HPLOT work in the same way as they always did... except that they have larger ranges. The command HPLOT 0,0 TO 639,767 produces the longest straight line you can draw on the

Graphics Tool Kit Review

The dimensions of the Toolkit card.

system. If those numbers seem to be a bit larger than the screen dimensions it's because the Toolkit actually maintains a larger virtual screen in its memory than it can display. You can move the display window over this terrain.

All of the shape table commands are functional... although with the same restrictions which have always applied to these things.

There are also a few new commands that the Apple will accept with the drivers in place. If you were to type SSAVE PIGFOOT.PIC the contents of the screen display would be BSAVED as the file PIGFOOT.PIC. Similarly, there is SLOAD for getting it back.

The system also installs a number of ampersand commands. For those unfamiliar with this facility of the Apple entering an ampersand character after the square bracket BASIC prompt on a fruit will invoke a user written routine if one has been installed. The ampersands in this case allow one to dump the screen contents directly to a printer and to scroll the display window up and down the virtual screen memory.

The Toolkit card produces a wholly monochrome display... you can have any colour you like provided it's green... or amber, or white, or whatever it is your tube normally likes to provide. As such, while the HCOLOR command is still accepted, it's interpreted slightly differently. Values from zero to four produce black images while everything else does white.

The HGR command works just the way it always did, except that it invokes the Toolkit's display, toggling the soft switch, rather than the Apple's high resolution image.

The drivers for the card are extremely well written. They interface to the system to a degree one rarely finds in third party things. In use they work as well as Applesoft itself... it's very easy to get into programming with the card.

There is also some more specialized software included with the system. Among the throng is a graphics editor which permits one to create pages on the high resolution screen. There's also a really decent vector editor. You probably didn't realize that your life has been a vacuous hollow shell without a vector editor. This is a chunk of software that facilitates the creation of Apple shape tables fairly painlessly for later display and movement about the Toolkit tube.

There is also software for displaying text on the screen, with the additional capability of defining what the characters therein will look like. You can also define the size of the letters... text up to seventy-two pixels high and eighty pixels wide can be accommodated. Naturally, large letters take up quite a bit of RAM just to store the patterns themselves. The system helps you keep track of how much room is available.

Naturally, font patterns can be saved to and loaded from the disk.

There is also a number of incidental images on the disk specific to particular tasks. You can SLOAD them into the Toolkit graphics window if you want to meddle with them. Included are such things as a ruled up blank drafting page and a score sheet for writing music.

The Inevitable Gotchas

The Graphics Toolkit is a splendid piece of work with no serious design flaws. There are

a few minor hassles, however, which potential users will do well to be aware of.

To begin with, the card is big. It barely fits into a standard Apple type case. It doesn't fit into many clone cases, and no amount of swearing at it will change this. If you don't use a real Apple it would be a very worthwhile five minute kindergarten activity to cut out a piece of cardboard to the size and shape of the thing... see the accompanying illustration... and try to jam it into a slot.

The slot you use isn't terribly critical insofar as the software drivers are concerned.

ed... they'll locate it when they're installed. However, the card must be in a higher slot than that of the Z-80 card if you use one, as this looks like a Toolkit to the drivers as it scans downward for its friend.

One of the largest gotchas is the power the thing draws. Ahem... it sizzles along dissipating just under two watts. This is really stretching it for a real Apple and not all that comfortable for even some of the enhanced clone power supplies. As such, in order to use the card one should plan on decimating the rest of the slots in one's fruit insofar as it's cool to do so. You'll want to keep the disk drive, of course.

A fan is essential, and leaving the top off the computer while the card is running is a good trip too. Tying the Apple to a large cube of dry ice or immersing it in a vat of liquefied helium is necessary only if you want to go on a programming binge lasting for several days.

Needless to say, the card pretty well has to be removed from the computer when you aren't using it. Aside from the heat it produces it also confuses some software which does similar scanning for other types of cards. This is a minor pain, as the thing is a bit of a squeeze to get in there in the first place.

In fairness, it should also be mentioned that of the many Apple compatible systems around our offices there was one which simply refused to run the card... although it runs everything else quite willingly. We don't know why.

Finally, the Toolkit display looks like a well cut diamond on a good monitor and not unlike a bowl of cream of newsprint soup on a bad one. If you have a really ancient nasty old box atop your fruit you may experience some hassles with it.

The Graphics Toolkit is a really decent thing, and well worth considering if you want to see splendid looking images on your monitor. The software is well written and documentation is easy to get through.

It's a slice, y'know...

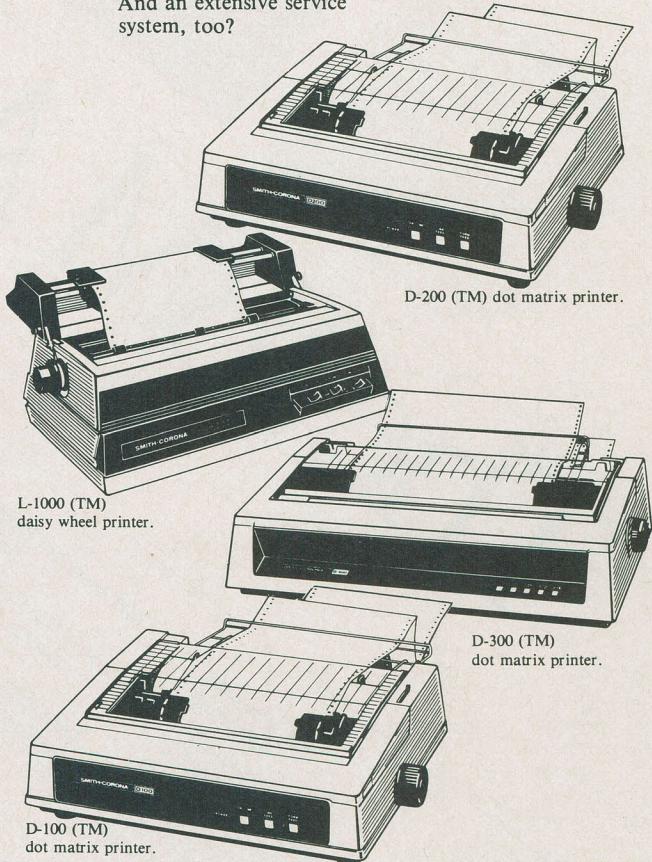

Question: What company offers a new daisy wheel printer, three dot matrix printers and a combination printer-typewriter, with suggested retail pricing of \$499.95 to \$899.95?

Question: What printer company offers print quality that challenges printers costing hundreds of dollars more?

Question: What printer company offers dual interfaces for all four of its printer models?

Question: What printer company offers removable and adjustable tractor feeds as standard equipment on all of its dot matrix models?

Question: What printer company has telephone numbers to call if you ever have a problem? And an extensive service system, too?

Please send me more information about Smith-Corona printers; I am interested in in-home use.

Please send me more information about Smith-Corona printers for office use.

Unpacking the CBM 8296

The Commodore 8296 is a splendid computer with a ragingly powerful integrated software package, an inoffensive name and a case that appears to have been designed by a leprechaun on acid. All in all, it's a first rate box from the folks that brought us computer adoration on the tube.

by Steve Rimmer

There are a number of good reasons why the new CBM 8296 will never become a really popular mass market chrome plated slick consumer computer. To begin with, consider the number. Commodore has always liked to give their systems numbers, most notably the locust-like plague of sixty fours. Consider 8296 as a really hip bag of digits... it just doesn't dance.

All together now... "I like to fix my 8296." It's a turkey of jingle... the meter's all wrong. Other possibilities, such as "I throw sticks at my 8296", "there are oil slicks on my 8296" or "shaved cats don't mix with an 8296" are marginally more aesthetic but suffer to an even greater degree from rampant meaninglessness.

If you do wind up buying one of these systems, then, keep in mind that you will never be able to get much interest in it when the conversation turns to computers on Sunday afternoons at the bullfights. Wearing a CBM 8296 button will make people think you are an employee of wherever it is you are standing at the time and attempt to address you by your number.

All of your glory will be silent.

The 8296 is, however, a very powerful machine despite its obtuse numerology. Lacking high resolution graphics, sprites, sound synthesis, joysticks, paddles, light pens and little cartoon swamp gnomes in its manuals it isn't a likely up market replacement for the home games machines. However, if you want to boogie down with the suits this is a meaningful contender. It's the latest CBM system for the office.

A PET Rock

The major screaming point of the 8296 is its intense integrated software package. Like so many other systems at the moment, the machine is not just a hollow shell full of BASIC, but, rather, comes up ready to handle a variety of useful business tasks. It has a built in menu which beeps and thinks for a second after one hammers the power switch and then offers the wary human such technological delights as word processing, a spreadsheet, file management, a telecommunications terminal, BASIC if you really must and easy access to its utilities.

This, even before one gets heavily into things, is a splendid enhancement over earlier Commodore computers. Because of the structure of the CBM "operating system"... actually an extension of the on board BASIC... running applications programs has always called for some unpleasantly computer like syntax. Having the menu spew this out in one's stead is considerably less involved.

In the tradition of integrated software, one can use the 8296 while remaining painlessly ignorant of all the workings of the computer itself. If you can recognize a disk drive and count from zero to one you can boot the system and call the functions from their respective sleeps. Having done this, of course, further cerebral resources may be called upon... you're on your own.

We'll have a closer look at the software integrated into the package in a moment.

The 8296 is not very different from most other Commodore machines in operation. Even VIC-20 owners will find themselves in fairly well trodden territory. It has a built in green screen monitor, a separate box with about a megabyte of mass storage on a pair of five and a quarter inch floppies and a detachable keyboard which, while similar in appearance to that of the low cost CBM home systems is rather nicer in operation. The case... well, yes, the case does look like a refugee from a late 'fifties B movie.

You should keep in mind that you don't compute on a case, though. The insides are

pretty good. This is what is called "ergonomics", and one day science will find a cure for it.

The computer itself is based on the well exercised 6502 microprocessor, the very same little beast that powers the Apple II+ and many furnace controls. It has a hundred and twenty-eight K of RAM in there, bank switched into two sixty-four K blocks, the upper, or expansion block of which is further subdivided into sixteen K blocks by the machine.

The computer is based on the 6502 microprocessor ...

This is all completely meaningless, of course, except that it works well with huge spreadsheets and other memory intensive things. The CBM's peripherals... notably, in this case, the disk drives... are not excessively fast. As such, the software tends to do its scratching and internal memos in RAM. Having all this memory available makes for some pretty slick applications.

Some of the software which uses all this silicon makes the 8296 a pretty nice box to sit in front of. For instance, unlike as in earlier CBM machines, there is the equivalent of four full screens worth of RAM set aside for the video display. This seems a bit pointless but, in fact, it allows data to be written to all four pages and then brought up instantaneously whenever it's needed.

The spreadsheet package integrated into the system, for example, makes use of this capability to hold its help pages. This is much slicker looking than the spreadsheets for other operating systems that have to fetch their help menus from disk files.

The 8296 supports the usual assortment of CBM interfaces for the outside world. In-

Unpacking the CBM 8296

cluded in these are connectors for two datasette cassette recorders, a simple eight bit user port for unadorned I/O and an IEEE 488 bus which handles most of the machine's system input and output... for example, communicating with the disk drives, the printer and a modem if you have one.

This unusual peripheral arrangement has its advantages, most notably that one need never find one's self lost for a port. Rather than being a simple interface, the bus structure allows a large number of external devices to be hung onto the same physical connector... in this implementation funny looking plugs allow you to snap 'em together like digital lego... and then selected in software.

In order to access the disk drives, for example, you tell the bus you want data from a specific file and tell it that you want the data to come from device eight. While not infinitely expandable this is considerably more flexible than systems which come with a finite number of ports and no way to easily expand upon them.

Soft Parade

The small petting zoo of software that comes huddled about the 8296 is called the *Excu-desk*, further proof that the lads at CBM have, indeed, been tuning into the late, late, late show when they air the Martian movies. However, despite this auspicious title the bits within the virtual drawers of this nonexistent desk are first rate stuff.

There isn't a generic package in the lot. Space, as they say, is the final frontier, and not having entirely conquered it its smallness we won't be able to go into really subterranean depth regarding all of the software. However, check out these snaps.

The first item on the power up menu of the system is word processing. If you choose this as your main course you get a roll and butter and thereafter a boot into that always popular character jammer, PaperClip. While there are other word processing packages for CBM machines this is easily one of the best.

PaperClip is a very capable system. It was written with the specific keyboard layout of CBM systems in mind so, for example, it is happy using the cursor keys to move the cursor... rather than meaningless control characters. Likewise, the screen editing works very much like that of Commodore's Microsoft BASIC. This will be meaningless to you if you don't program in BASIC... suffice it to say that the Commodore BASIC editor is extremely good.

Using the package is quite a bit different from entering text into many of the

This is it... the case! Note the detachable keyboard.

more common full screen editors, such as trusty WordStar. To begin with, the system does not do any on line text formatting when you type stuff in. Rattling away on the keyboard produces a screen full of broken lines and things that simply reach the end of the tube and wrap.

Hitting the carriage return key puts an arrow symbol on the screen to indicate that a paragraph has ended or that you don't type terribly well.

The text can be edited by placing the cursor on a line and hitting the insert key to open up some space or delete to snuff offending characters. There are control sequences, initiated by the reverse on key... it's located in a convenient spot... to do more complex things like saving and loading text, search and replace, inserting lines and so on.

When you finally get the jumble of text on the screen reading the way you want it to you can make it look real with a formatting

command. This doesn't do much for the mess you've created... like a great original, it's left untouched. Instead, it produces a formatted version on another page of the computer's video RAM and pops it into existence.

You can format text onto the screen or out to a printer. We didn't have a printer that the machine could talk to and formatting it out into the atmosphere seemed pointless.

Word processors are among the most user sensitive applications going. If you play with enough of the gibbering trolls you will eventually find one that will behave for you. PaperClip is a good one to try... it's much faster than the WordStar package I live by and worlds simpler to master.

Three Sheets to the Wind

The spreadsheet for the 8296 is called CalcResult from Handic Software of Sweden. Don't worry... the documentation's

Circle No. 8 on Reader Service Card

Unpacking the CBM 8296

in English. It looks very much like a spreadsheet, works like one and won't fool anyone if you tell them it's Zaxxon in block graphics.

CalcResult is extremely quick as spreadsheets go... again much faster than most of the popular Z80 based packages. It seems to make quite a lot of use of the flexible video pages of the system, so screen updates are essentially instantaneous. The cursor is moved with the cursor mover keys and most of the standard VisiCalc style spreadsheet syntax is supported.

There's a really excellent manual which comes with the thing for users who are still used to conversing in something other than VisiCalc style spreadsheet syntax.

"Pardon me, James... SUM(B4:K12)?"

"Rather..."

There are features found on other spreadsheets which are definitely lacking in CalcResult. However, few if any will be missed in the general application of the system. As often seems to be the case with software designed for Commodore systems the authors of this thing have forgone a few esoteric features in favour of additional memory, speed and ease of use for the stuff one normally bangs away on most of the time.

The system has such noble bits as GOTO, REPLICATE, row and column erase, matrix movement and several permutations of recalculation. It can update its information on every entry, do global recalculation and even allows for recalculation which starts in places other than the normal upper left hand corner of the screen.

For the real spreadsheet aficionado there is a complete windowing facility. If you get sick of looking at one dull, lifeless sheet you can split the screen and see two of them. You can also punch a hole in your primary sheet to peek through a window at another one.

The windowing facilities take a while to fully get your head around... they're very flexible.

The package can display its data as bar graphs if you're into visual things. While it isn't Lotus it is a very nicely crafted application.

Further Adventures

The Consultant is a horrifyingly large data base manager... well, the books are pretty frightening, anyway. You get these two fierce behemoths with moss encrusted cast iron spiral bindings that look like they've been placed there by the demons of the underworld, for centuries daring mere humans to peel back their dreaded pages.

All right, then, they aren't exactly cast iron.

You can't really evaluate a data base management package in a couple of weeks... the Consultant worked very well for us, which means nothing because we weren't really able to set up work files that even began to approach the size of those which one generally spews forth upon the sacred mylar after a few months of storage.

The system seems to be pretty tight. It didn't explode or refuse to part with information we knew we had put in there... some of them do, you know, probably just to fox a human now and then. It was really quite fast and reasonably flexible in things like the sizes and numbers of fields it would accept and so on. It wasn't dBASE II but, then, we can't all be slow, funky and inefficient.

Specs...

System:	Commodore 8296
Processor:	6502
Memory:	128K
Operating system:	CBM Basic
Software:	Word processing, spreadsheet, data base, manager, telecommunications terminal, financial planners, BASIC No
Graphics:	80 x 24
Screen display:	1.05 megabytes on 2-5/4 inch floppies
Disks:	Local Commodore dealers
Distributor:	\$1695.00 (computer only)
Price:	

There are three smaller functions on the system's menu. These include a telecommunications terminal, a collection of small business routines tied together as "financial planning" and a similar bundle of system utilities for formatting disks and the like. Being menu driven they're all terribly approachable.

The terminal is pretty straight up... it allows you to configure its assorted parameters through submenus. It has a text capturing buffer... which it can dump to a disk file for a poor man's download. It also has programmable macros, so you can have strings ooze out through your modem at the touch of a key.

The financial routines are actually fairly good. They can calculate amortization, annuity, future value, depreciation and other

such useful things. The amortization tables are depressingly accurate... we just bought a new cave and I'm not really sure I wanted to know how long it's going to take to pay the thing off.

Drastic Plastic

There are a number of good reasons to hock the dog and buy one of these things. Dogs are a nuisance when you don't feel like feeding them for a few weeks. They like to bury bones in your house guests and they frequently chew mail that contains cheques.

The computer's pretty good too. It's solidly made, well supported and can avail itself of a pretty decent library of software. It appears to be capable of handling any of the software written for Commodore's 8000 series of systems.

The 8296 is, on the whole, rather nicer to use than many CP/M based computers and certainly more so than MS-DOS based ones for what it can do. The integrated software package provided with the system is powerful, convenient as a force field in a crowded subway and assembled from among the best individual packages available for the system rather than all blasted together by a single programmer.

You should buy a computer on the basis of the software it will run, or, to look at it differently, you should see if you can get into the packages and then check out the box that's around them. The 8296 is a nice box... so long as you can get along with the applications bundle that comes with it.

As is the case with all CBM systems, you are essentially stuck with Commodore's operating system and facilities. Claims by third party suppliers notwithstanding you really can't run CP/M, MS-DOS or any other extraterrestrial manifestations on it no matter how many doodahs you plug into the back. At least, you can't do it so as to have anyone want to actually operate the machine.

This is not a bad thing... there's nothing particularly slimy about the CBM software. However, before you consider enriching your karma with one of these computers make sure you know what applications are available for it and how closely they match your needs and fingerprints.

The last aspect of the 8296 to consider is, of course, that case. It's best related to by immersing the system in boiling fiberglass for a couple of hours or looking at it through welding goggles. Perhaps some day glo flowers stuck on the side... a couple of pairs of stockings and a can of latex paint... a string art kit wouldn't hurt it any. There's always incorporation into a goldfish sculpture...

CN!

Powerful CP/M® Software

For Apple, Osborne, Kaypro, Rainbow, NEC, Epson, Heath, Xerox and others

\$5995

Now only

each!

NEVADA **COBOL™**

When we introduced Nevada COBOL in 1979, it was loaded with innovations. Today's Edition 2.1 is even better!

- Extremely Compact. You can compile and execute up to 2500 statements in 32K RAM, 4000 statements in 48K, etc.
- It's based upon the ANSI-74 standards with level 2 features such as compound conditionals and full CALL CANCEL.
- You get a diskette, 165-page manual with lots of examples and 16 complete COBOL source code programs.

Also available: COBOL Application Packages, Book 1

NEVADA **FORTRAN™**

- FORTRAN IV based upon ANSI-66 standards with some 1977 level features.
- IF . . . THEN . . . ELSE constructs.
- A very nice TRACE style debugging.
- 150 English language error messages.
- You get a diskette, including an 8080 assembler and Nevada FORTRAN rev 3.2, 214 page manual and five sample programs. Requires 48K RAM.

NEVADA EDIT™

- A full-screen video display text editor rev. 3.1 designed specifically to create COBOL, PASCAL and FORTRAN programs.
- See the review in May 1983 Microcomputing.

VECTOR COMPUTER SERVICES LIMITED

32 Falconer Terrace N.E.
Calgary, Alta. T3J 1W4

Phone (403) 280-4185

The CP/M Operating System, an 8080, 8085 or Z-80 microprocessor, and 32K RAM are required, unless stated otherwise above.

Diskette format:

- 8" SSSD (Standard CP/M IBM 3740)
- 5 1/4" Diskette for:
 - Apple CP/M
 - DEC VT 180
 - DEC Rainbow
 - Epson QX-10
 - Heath Hard Sector (Z-89)
 - Heath Soft Sector (Z-90, Z-100)
 - IBM-PC (Requires Z-80, CP/M-80 card)
 - Kaypro Double Density (NCR)
 - Micropolis Mod II
 - NEC PC 8001
- North Star Double Density
- North Star Single Density
- Osborne Single Density
- Sanyo 1000, 1050
- Superbrain DD DOS
- 3.X (512 byte sec)
- Televideo
- TRS-80 Model I Base Mapper
- Xerox 820 Single Density

Satisfaction is guaranteed - or your money back. If for any reason you're not completely satisfied, just return the package - in good condition with the sealed diskette unopened within 30 days and we'll refund your money.

Circle No. 9 on Reader Service Card

NEVADA **PASCAL™**

This newest addition to the 8-bit Nevada product line has many advanced features:

- 14-digit precision, BCD Math, no round-off errors with decimal arithmetic for business and floating point +63 -64 for scientific.
- A very nice TRACE style debugging.
- Arrays up to 8 dimensions and 64K strings.
- External procedures and functions with dynamic auto-loading.
- One-step compile, no assembly or link required.
- No limits on size of procedure, nesting levels, recursion.
- Requires 60K RAM and one disk drive with at least 90K storage.
- You get a 184-page manual and diskette rev. 4.1

NEVADA **BASIC™**

- This interpreter has a built-in full-screen editor.
- Single and Multi-line functions.
- BCD Math - no round-off errors.
- Full Matrix operations.
- Requires 48K RAM.
- You get 220-page manual and diskette rev. 2.5.

NEVADA PILOT™

- See review in January 1983 MICROCOMPUTING.
- You get a diskette rev. 6.1, 131-page manual and ten useful sample programs.

Vep 46 EPROM PROGRAMMER/ ERASER

**\$449.00 Specify IBM®
or Apple Host Adaptor**

The VEP 46 is a totally new concept in EPROM programmers that gives a high degree of freedom to the programmer. Software supplied allows access to the entire memory array of the host computer so that sections of ROM can be examined, moved, edited, and copied to up to 4 EPROMS at one time. Novel BIOS programs can be composed and tested easily and rapidly, the built-in UV lamp allows erasure of up to 10 EPROMS at one time in 20 minutes. Any 5V EPROM, with few exceptions can be programmed. Currently host adaptors are available for the Apple and IBM machines with Commodore to be ready soon. The VEP 46 comes with an extensive manual with step by step instructions showing how to do everything simply and easily. Some features are:

- CSA approved power supply
- Compares up to 4 EPROMS to reference EPROM, lists all errors
- Verifies up to 4 blank EPROMS
- IBM® version now ready
- Takes no power from host
- 2716, 2732, 2732A, 2764, and 27128 EPROMS programmed
- Built-in UV erasing lamp
- Edits
- Apple® version now ready
- Commodore® version soon ready
- Programs up to 4 at once
- Uses ZIF sockets
- Bleaches 10 EPROMS at once
- Disc driven
- Examines all Host memory data
- Priced at a very low price

GREAT DEAL

Memory, wire wrap, with 256K/1M memory grid-
ded onto card front, rest holes \$34.95
Card extender, lifts any plug in card up by about
6" for easy service \$29.95

Character for the IBM PC

The character set of the IBM PC is all right for mere words, but when you want to PRINT pictures it's sadly lacking. It's time to send a couple of trolls in there with their tiny chisels and hammers and three speed reversible sabre saws to change a few things.

by Steve Rimmer

The graphics possibilities of the IBM PC are exceeded by virtually no other personal system... except for a few of the enhanced compatibles. Safely ensconced in the tender claws of Microsoft BASIC there are more ways to draw pictures on the tube than a disassembled carburetor has missing parts.

Most of the high resolution things, like LINE, DRAW, PUT and GET and so forth suffer from some speed problems. Animation in BASIC using the more sophisticated drawing techniques is both an exercise in long waits and tricky due to the high amounts of memory overhead some of these things take.

The best way to get fairly convincing animation is often to use one of the oldest approaches going, to wit, simply moving the characters around on the screen. However, while this works nicely on, say, a Commodore 64, which has a rich selection of graphics primitives in its character set, it is less than practical on an unadorned PC. The area of the character set which contains shapes and lines and such under DOS is blank under most implementations of BASIC.

In fact, it's possible to define the upper hundred and twenty-eight characters to suit your needs. They can be shapes to put

together and form aliens with, special symbols for scientific or foreign language programs or an alternate typeface for use when you get sick of the one IBM supplies.

Getting access to the upper range of patterns is fairly easy. Making use of them, while not particularly involved in theory takes an awful lot of pencil grinding to actually get something happening with in this spatial dimension. One really needs a character editor... which is not a serious problem, as we've printed one in the next few pages.

Byte The Dog

The IBM's arrangement for defining its character set is a bit strange. The lower half of the range... the ones which normally crop up on the tube as a result of dropping things on the keyboard... is fixed in a ROM. The upper half, however, can be anywhere it feels like being.

There's a sixteen bit word at location 7CH that serves as a pointer to the block of RAM which we want the PC to regard as holding the character patters for the upper hundred and twenty-eight characters. This can be wherever you fancy. If it points

Listing 1

```

MDM730 for the Apple!!!

MDM730 is one of the most powerful MODEM7 programs available... and the Computing Now! version of MDM730 for the Apple II+ and clones thereof incorporates features not available in the public domain editions. If you are into telecommunications, bulletin boards and downloading software your life will be full and meaningful with this code. Consider the internal trolls.

- Terminal program which works at any baud rate.
- Ten programmable macro function keys.
- Thirty six number phone library.
- Christensen software transfer protocol.
- User settable toggles for line feeds, XON-XOFF and so on.
- Extensive help menus.
- Baud rate selection on the fly (or the spider).
- ASCII dump and capture.
- Status menu
- Many more features.

In addition to all this splendor, however, we've added dialing support for the Apple. While the standard MDM730 cannot dial unless it's hooked to a Hayes Smartmodem, we've added patches to it to allow it to do pin twenty five pulse dialing and to dial through the Hayes Micromodem II and the SSM card. The Computing Now! MDM730 will also

- Select a number from the library and dial it
- Accept a hand entered number and dial it
- Wait for carrier
- Log you onto the remote system if it's free
- Optionally autodial if the remote board is busy.
- Count the number of attempts at dialing the remote BBS.

The Computing Now! MDM730 package is available for

- The Hayes Micromodem II.
- The SSM 300 Baud modem card.
- The PDA 232C serial card with external modem.

The PDA 232C package includes versions supporting both the Smartmodem and a dumb modem with pin twenty five line control, such as the Novation AutoCat.

Also included with each package are utilities to permit easy alteration of the phone number library and the function key macro strings plus an extensive documentation file.

The source code file for this program is over a hundred and fifty kilobytes long. It cannot be hacked on a standard Apple. We patched it on a larger machine and downloaded it. As such, we're pretty sure that MDM730 with these features is unavailable elsewhere.

Just
The cost: \$29.95

Fine Print:
The original MDM730 code is in the public domain. We are offering this part of the program without cost. The charges for this package are for the patches created by Computing Now! and to defer the cost of handling and postage.

This software is guaranteed to work correctly if properly applied. The serial cards must be installed in slot two of an Apple II+ compatible system with at least 48K of RAM running Microsoft CP/M 2.2. The PDA 232C version will require the availability of either a Hayes SmartModem or a modem with pin twenty-five line control to dial. Users of the SSM card version may experience some difficulty in detecting extremely faint carriers on older versions of this card.

Character for the IBM PC

ing the start of the block plus (ASC(C\$)-128)*8, where C\$ is the character.

In using the character redefinition capacity of the PC one must first of all decide where the patterns are going to live. The BASIC package provides for the facility of using CLEAR to block off RAM above BASIC's work area... in this case we'll use F000H and above. It's also profound to tell BASIC what memory segment we'll be using... zero, in this case.

Having done this, we must point the PC to the table by storing its location in the registers at 7CH and 7DH... there are two bytes to hold the sixteen bit address.

Now, if bytes are POKEd into RAM from F000H to F008H they'll form the pattern for CHR\$(128), the first of the redefinable characters.

Assistant Editors

Turning to listing one, the character editor is a fairly modest BASIC program. It provides a large grid of eight by eight blocks... representing the eight by eight matrix of pixels of a character. The function keys are used to move a cursor around the box and set pixels on or off. Once you get the pattern of pixels the way you want them you can place them in your choice of character positions... the whole works is displayed at the right of the screen and updated whenever you change something.

Completed character sets can be saved to disk and later re-loaded for additional editing or to actually do something with. The short code fragment in listing two can be used to load in a character set and hook it into the operating system from within a program. Thus, for example, you can design a font to hold Sanskrit characters and then use listing two to haul them into memory and set up the pointers and such at the beginning of your Sanskrit word processing program.

A Sanskrit word processor would be a decided gift to humanity and the universe in general. People who write in dead languages have a very poor selection of applications software.

All of the functions of the editor are handled by the system's ten function keys. Their uses are outlined in a menu that's displayed at the bottom of the screen. The squirming mass of KEY statements beginning at line two-forty activate the keys and set them up for use.

Listing 2

```
10 CLEAR, &HF000
20 DEF SEG=0
30 POKE &H7C,&H0 : POKE &H7D,&HFO
40 POKE &H7E,PEEK(&H510) : POKE &H7F,PEEK(&H511)
50 DEF SEG
60 BLOAD "SET1",&HF000
70 END
```

The menu is fairly self explanatory.

Take a Letter

The character definition system of the IBM is extremely flexible. For example, you are not limited to having only a hundred and twenty-eight symbols at your disposal. It's possible to store any number of character sets in RAM and change the pointers to have the PC look at the one you're interested in at the moment.

Character graphics represent the quickest and generally the easiest way to do BASIC animation on the blue beast. While a bit coarse for positioning and such they are quick to place... all you have to do is to PRINT them. We'll be looking at some applications that make use of redefined characters in a future issue.

To begin with, let's try defining all the I's, B's and M's as smiling faces...

CN!

Preschool time

Software that cares. Our preschool programs do more than entertain; they help develop important early learning skills and encourage youngsters to explore as they have fun. Children interact with exciting graphics, animation and sounds, creating a wholesome learning environment that challenges without frustrating. Programs developed by the CTW Software Group, a division of Children's Television Workshop (creators of Sesame Street, The Electric Company and 3-2-1 Contact), feature Ernie and Big Bird — friends to children everywhere.

"Kaypro 2 ... \$2095... Complete..."

Oh, mentor of highest wisdom,
help all mystified first-time buyers
discover the ultimate truth about
personal business computers.

Tell them that, unlike other
computer companies, Kaypro
does not advertise a low "starter
system" price, then charge extra
for so-called "options" like a
monitor, software, disk drives or
peripheral interfaces.

Tell them that Kaypro 2 has
become the fourth largest-selling
personal business computer
because we sell it complete. For
\$2095.

Tell them that Kaypro 2 comes
with a highly readable, 9" green-
screen monitor. A 64K RAM,
Z-80 microprocessor. Two built-in
disk drives with a 400K
capacity. A more complete key-
board than Apple IIe. Interfaces
for both a printer and a tele-
communications modem. And a
full complement of CP/M soft-
ware to handle the overwhelming
majority of Word Processing,
Data Base Management and
Financial Spreadsheets needs,
with top quality programs such as
Wordstar.

All for \$2095.

Then, tell them to call
(403) 482-7363 for their nearest
dealer, or write Computron:
10641-123 Street,
Edmonton, Alberta T5N 1P3

KAYPRO

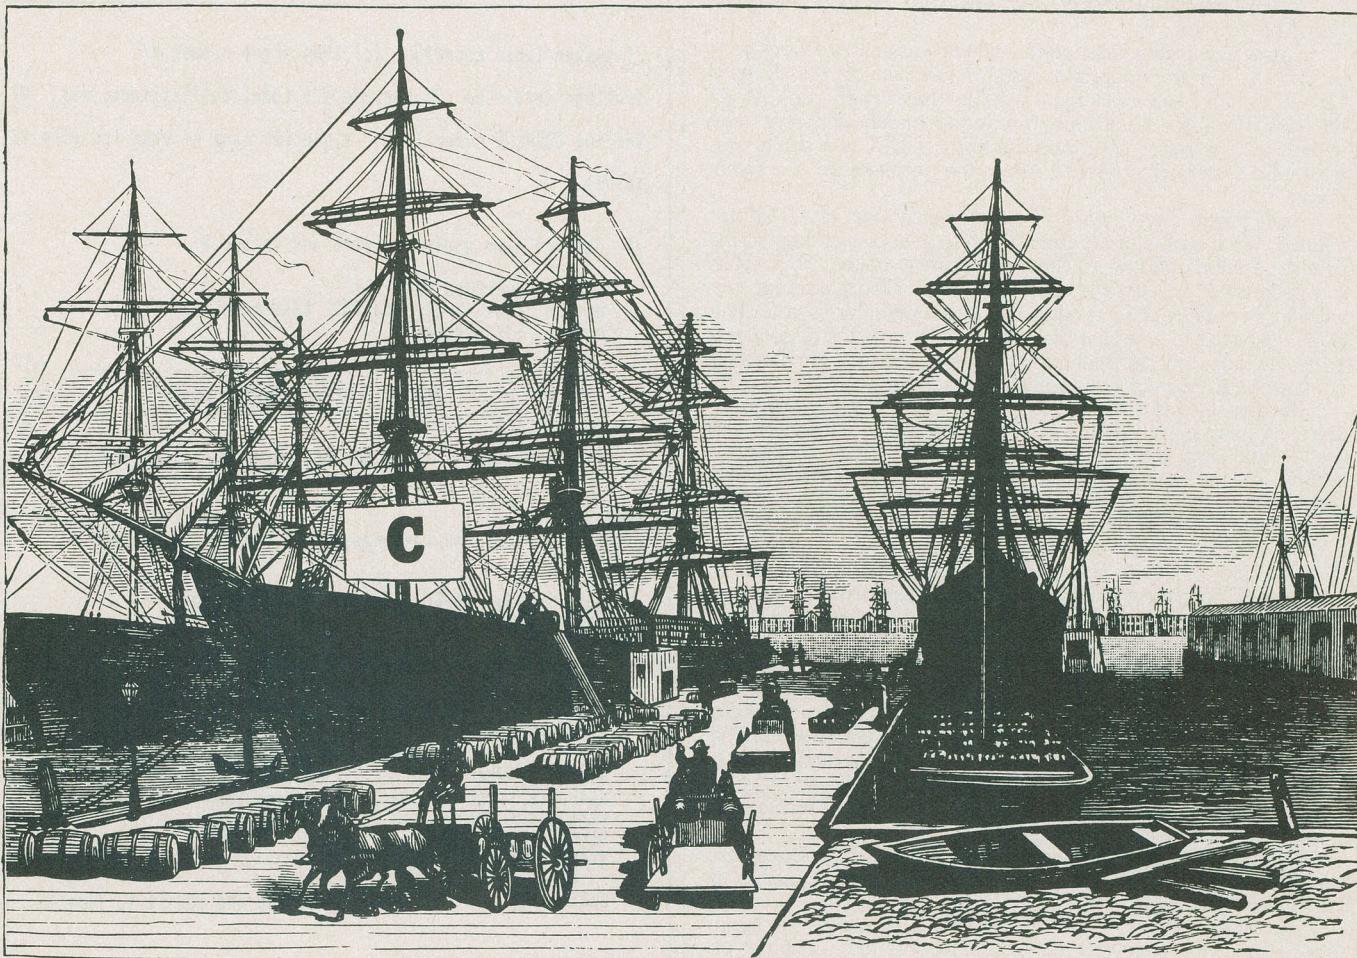

The \$2095 computer that
really sells for \$2095.

Down To The Ships in C

The C language is like no other... it's a bizarre little tongue unique unto itself. However, its portability, flexible structure and tight results make it attractive despite its lexical peculiarities. Here's an opportunity to get your toes wet.

by Steve Rimmer

Computer languages scurry like small pink eyed rats amongst the feet of technology. They're everywhere.

There are specialized languages designed for use in all sorts of areas and general purpose ones for every system on the planet. Some, like PASCAL and BASIC were never really intended by their creators for use as dignified serious programming tools at all.

Some others were designed to be so mind stranglingly serious as to render comatose all but the most ardent programmers who attempted to apply them. One of the most fiendish of these is the heavily mysterious dialect of C.

There are really good programmers who will turn immediately to jelly if you so much as mention C. It's kind of fun to watch this, and you can usually get a few dozen good sandwiches out of the remains if you're handy with a bread knife. The

fact is that C is regarded as being one of the most ill tempered, unapproachable, difficult programming languages ever devised by minions of a large corporate entity.

There're good reasons for this, and, after reading this article you may have cause to believe some of them. However, the advantages of C can far outweigh its drawbacks in many applications. We're going to look at a few of its good points and at several really weird aspects of this bizarre little piece of work.

The Palace UNIX

It's probably worthwhile beginning with the historical stuff. The C language was originally developed by one Dennis Ritchie of Bell Labs in 1972 as a programming tool to assist him and one other Ken Thompson to develop UNIX.

Down To The Ships in C

You're probably asking what UNIX is... good. The coma hasn't hit you yet.

Large mainframe computers... which was all there were back in 1972... require operating systems just like micros. Even if MS-DOS had been available it wouldn't have been adequate to the task because mainframes are conceptually different than micros in a number of important ways. UNIX is a multi user operating system designed to run in the architecture of a mainframe.

You might have heard of implementations of UNIX for micros... we'll be featuring an in depth look at one of them in the premier edition of Software Now! magazine... called QNX. QNX is a product of an Ottawa based company called Quantum software and contains, among other highly splendid things, a C compiler. It was this C compiler that was used to write the code in this article, in fact... but don't let this worry you. The fact you that may not happen to have QNX is actually one of the *good* points of C.

Because C was designed by Ritchie to be used by programmers it's heavily into flexibility and not terribly burdened with user friendliness. Manuals for languages tend to relate them to BASIC, on the assumption that most people know BASIC and that the rest know English, which is nearly the same thing. Manuals for C that do this are a bit pointless... C is nothing like BASIC and doesn't explain well in English.

You kind of have to pick up the vibes, y'know, and just get into the flow. That's not a wholly flippant comment, either... more so than with any other programming language a working understanding of C is very much an intuitive quantity.

Languages like BASIC and PASCAL are very sophisticated translators of human like expressions into machine level code. When you say PRINT in BASIC a couple of hundred... maybe a couple of thousand... bytes of code wake up and get to work. The equivalent in C, a thing called *printf()*, is a tiny little bit of code. It has much of the flexibility of PRINT in BASIC, but it is an order of magnitude more primitive in its ability to handle data and format its work. It's also quite a bit smaller.

This points up the first major advantage of C. It produces extremely fast, tight code. It can do things simply not possible in BASIC for this reason.

The other very profound thing about C is that it's transportable. This is why it doesn't matter... at least to me... whether or not you are using QNX, or even know what it is. It matters to the folks at Quantum, of course, and, if you check out the feature in Software Now! you'll probably come to the blazing realization that it's a really fine thing.

This is only partially germane to the code that's written using the Quantum compiler. Much the same code could have been done with Supersoft C, Software Toolworks C, BDS C, Lattice C and, in fact, any of a number of other popular C compilers. The whole idea is that C source code written on one system can be moved or, if you want to use one of the technowords, *ported*, to another system, compiled on that machine's C compiler and run all with little or no alteration.

Because C primitives are very much more in keeping with the literal meaning of that term than are those of BASIC or PASCAL, it's a lot quicker and easier to write a C compiler than it would be to do a BASIC interpreter for a new system. In fact, it's become almost traditional for developers of new chips and machines that use them to place C compilers into the public domain shortly after releasing their stuff so that software developers can get cracking on applications code.

This is not to say that all C compilers work exactly the same. There are generally minor differences in the way each treats the standard C library of functions. However, C is as close as anyone has come to a truly portable universal language to date.

Its mobility, coupled with its flexibility and tight results makes C a decent thing to work in. This does not change its sparkling bizarries one bit though, and, if you've already glanced at the example programs included with this feature you'll probably have realized why towering stacks of abandoned BASICs do not litter our streets and parking lots as people rush out to embrace C.

```
/* system login copyright (c) 1984 steve rimmer */

#include <stdio.h> /* include i/o code, definitions, etc. */

#define USERLOG "user.log" /* specify name of user log file */

main()

{
    /* declare some useful buffers and things */

    extern unsigned date[2];
    extern char first_name[38], last_name[38];
    extern int status;

    printf("\n -----");
    printf("\n: Wombat Brothers System Logon ");
    printf("\n -----");

    fetch_names();      /* get the names & call update */
}

fetch_names()
/* get the first and last names into respective buffers */

{
    auto    char first_name[38], last_name[38];
    char s[80];

    printf("\nEnter your first name: ");
    gets(first_name);
    printf("\n           Last name: ");
    gets(last_name);

    strcpy(s,"User: ");      /* concatenate the strings */
    strcat(s,first_name);   /* copying them into the new */
    strcat(s," ");           /* string... s... */
    strcat(s,last_name);
    strcat(s,"\n");

    update(s);      /* pass the string and add it to file */
}

update(s)
/* add the user to the user's log */
char s[80];
{
    auto    char first_name[38], last_name[38];
    int    c, err;
    FILE  *fp;

    fp = fopen(USERLOG,"a"); /* open the file for appending */
    err = fputs(s,fp);       /* write the string to the file */
    printf("\nUser log updated\n");
    fclose(fp);             /* close the file & split */
}

/* end of log program */

```

UNIXcrons and Other Near Myths

The form of a C program is always that of a collection of nested functions. If you get into UNIX you'll note that this is analogous to the form of a UNIX command path... but don't worry about that just yet.

If you want to get your head around this a bit easier, consider that even the simplest C program consists of at least one user written function. The prime function is always called *main()*. The little brackets after it tell C that it is a function. You can call all the other functions you write anything you like so long as the first one is called *main()*. This is the one which is, in effect, called by the operating system when you run the program.

There are two types of functions from here on. When you

buy the compiler you will get a *standard library* of functions written by the heads that did the compiler. These do the things languages are usually up for providing, such as printing to the screen, getting characters from the keyboard, manipulating strings, handling disk I/O... all the low level stuff.

The other functions you'll have to play with will be the ones you write yourself in the course of developing a program. When one writes a function in C one has all the existing functions to do it with. Thus, a C program is best thought of as a tree, with the most primitive functions... the ones in the standard library... being called by more involved ones called by more involved ones and so on until you reach the meta function, *main()*, which is called by the operating system when you boot the program.

The form of a function is fairly standard... although it looks a bit weird the first time you come upon it. Let's look at the function called *fetch_names()* part way through the first example program *log.c*. The first thing sitting there waving its flag is the declaration of the function's name... with the aforementioned brackets after it. They're empty here, but in many cases they will contain one or more *arguments*, things to be passed to the function as data.

Following the name of the function we encounter the first typographical unpleasantness of C, the opening curly bracket. This means that everything within the outermost pair of curly brackets is a part of the function. More inward pairs of brackets, if any existed... they don't here... would block off portions of the code to be regarded as the province of loops or conditional statements. We'll explore that a bit more fully in a moment.

Having successfully circumnavigated the curly brackets the next port of call is the variable declaration. Unlike as in BASIC, C requires that it be told about any variables you plan on using before you actually get them going. This is called *declaring* your variables. It's a bit like declaring stuff at customs... with similar uncool results if you're caught fibbing.

There are a number of classes of variables in C, of which only a few are used here. Most popular of these are *char*, for character, and *int*, for... predictably... integer. There are also *long* variables, *short* variables, *unsigned* variables and some more specialized ones, which we'll leave for the buzzards in the relentless scorching desert sun. The few we do use will be sufficiently confusing.

The names of variables in C can be anything you like providing that you keep in mind that they are significant to only eight characters. Consider that *aardvark* and *cardvarks* are both the same variable as far as C is concerned as the s on the end of latter is the ninth character. C is also selective about case, so, for example, *wombat* and *WOMBAT* are two unique variable names.

Programs in C are traditionally done in lower case, for the most part.

One of the things that bothers many new users about C is the propensity of C programmers to use a lot of underscores. None of the C manuals explain what these things do because, in fact, they don't do anything at all. The underscore character is simply a null character used to join two words to create a more readable variable name. The expression *first name* is illegal under C. You can use *firstname*, but it's a bit awkward. A much better thing is *first_name*... which is all the underscore actually does.

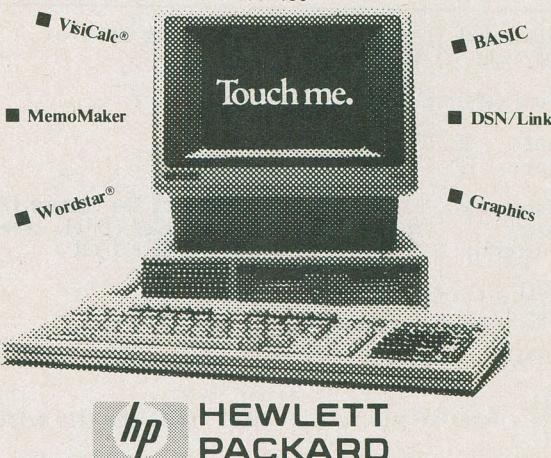

The variable declaration *auto* is a bit more complicated than the others we looked at. Back up in the *main* of this program I declared a number of *external* variables. These are variables which can be accessed by any function in the program even if they are not passed to said functions through the mysterious brackets after the function's name. However, most C compilers would really be much happier to be told about the existence of any external variables they are going to be expected to access... which is handled by *auto*.

Now, all of the variables in this function happen to be *chars*... but they're weird chars. They are what are called in PASCAL *packed arrays*, something which defines them nicely in C, too. The definition *char c;* implies that C will hold a character. If we enhance this a bit, into *char c[80];*, we are saying that this variable can hold a string of eighty *chars* in a row.

    }

    toot(); /* sound the bell */
    {
        putchar(BEL);
    }
}

/* end of view program */
```

It's probably worth mentioning the semi-colons around about now, having just slung a couple of them into the party. These aren't as mysterious as they seem... C likes to know when you have ended a logical line, as this is frequently not the same as the end of a line of text. This is handled by tacking a semi-colon onto the end of each complete statement.

The Nuts and Bolts

Having browsed through the catalog of impending variables in the *fetch_names()* function we now get to a block of four function calls. These four are all primitives, that is, they come pre-written for us by the provider of the compiler. These two are heavily profound. The *printf* function is analogous to the BASIC PRINT, although, as we'll see, it is used rather differently. The *gets* bit is something like INPUT.

The syntax of *printf* is quite sophisticated... it's rather more involved than virtually any other C function. The use here is fairly simple. We'll speak with some more enlightened manifestations of it shortly. In this case, everything between the quotes will get printed... except for the backslash *n*.

It's useful, in C, to represent certain characters as what are called backslash or escape sequences. Among these are *n*, for *newline* and *t*, for *tab*. These things can be placed within quoted strings and they'll still print their meanings rather than a literal backslash and a character.

The next bit after the *printf*'s and *get's* is a humming nest of string manipulation functions. *strcpy()* copies one string into another and *strcat* concatenates... adds together... two strings. This may take a bit of getting used to, as BASIC programmers will be used to simply using the equal sign to get this together.

In fact, you can just say *string1 = string* in C, but it doesn't have the meaning one would expect. You see, the variables in C do not really represent the data that is assigned to them. They are actually *pointers*. If you were to assign the variable *treetoad* the string "small green eyed frogs" what *treetoad* would actually hold would be a memory address which would hold the first byte of the string. Thus, saying that *treefrog = treetoad* would simply make the two pointers equal. Adding two strings together in this way would add the two *pointers* together, making the result point to some other, most likely meaningless, section of memory.

The *strcat* function, then, copies its second string onto the end of its first string... a very different thing.

Finally, this function contains another function call. This last function is one that I wrote with my own flying fingers... it appears directly below. Note that we are passing the function something, to wit, the string *s*. The string is properly an argument.

The function closes off with a right curly bracket, indicating that the performance is over.

The Real World

Having looked at some of the basics of let's now turn to these example programs. While none of them are particularly simple taken as entities, they are comprised of simple bits. This is the nature of C. Understanding them should give you a fairly decent insight into what's happening in C as a whole.

Since we've looked at program one, *log.c* in some detail, let's check out its operation. This routine is a log on for a multi-user system or, with a bit of work, for a bulletin board. It asks for the user's first and last names and adds them to a log file.

Having looked at how C works understanding the first two parts of this program should be fairly straight up. Note that it consists of three functions each calling the one below it... this is a fairly simple structure. Most C programs get much more involved than this.

The first thing in the program, even before the *main()*, is a pair of instructions to the compiler. The first thing we do is to *#include <stdio.h>*. This means that the compiler is to suck in this file, stdio.h, and pretend that it is where this directive lives in the text file. In fact, this file contains all the code which is needed by the compiler to handle screen and disk I/O... the function *printf*, for example, lives in there. It's provided as part of the compiler and *#included* in virtually every program.

The *#define* directive allows us to concoct *labels* and assign them fixed values which are plopped into the code whenever the compiler encounters subsequent occurrences of the label. Labels are traditionally upper case to avoid confusing them with other C keywords.

In this case, we have assigned the label USERLOG the string 'user.log', a legal file name under both UNIX and CP/M. You can think of this as a search and replace thing... whenever the C compiler locates the label USERLOG it will replace it with "user.log".

The lines which are enclosed in these little gophers, /* */, are comments. The compiler ignores them. In a trackless language like C profuse comments can be the only thing keeping you from wandering off into the jungle and becoming lost for all time.

The *update()* function is probably a fairly nasty thing to get into as an early example of C programming. It handles a disk file, usually a reasonably unpleasant thing in any language. Notice, however, that while this function is really headbending to look at in C at least it's really short.

The first thing we encounter in *update()* is a variable declaration. Check out its location... it occurred outside the curly brackets. This is important... it declares a variable which is passed to the function as an argument, rather than one which is being created for use within the function. These latter ones would be declared within the brackets.

There's a new variable type here, too, called *FILE*. It is, not surprisingly, a file name. Note, however, the inscrutable presence of the asterisk before the variable name, *fp*, that it's declaring.

```
/* time program for UNIX on PC      */
/* copyright 1984 (c) steve rimmer */

#include <stdio.h>
#include <timer.h>

#define SCR_VERT 24      /* this is a bunch of defines that */
#define SCR_HOR 80       /* are frequently useful in assorted */
#define LF    10          /* c programs. only the last one is */
#define CR    13          /* used in this one. It's handy to */
#define BEL   07          /* keep 'em all in a file and read */
#define BS    08          /* them in when you start a program. */
#define TAB   09          /* it's even slicker to put them in */
#define CRT   28          /* a .h file and #include them.      */
#define CLT   29
#define FF    12

main()

{
    unsigned date[2];

Down To The Ships in C

This means that the name is implicitly a pointer to the string *fp*. In other words, if the string were to be "user.log", printing *fp* would return user.log while printing **fp* would return a memory address.

The first function in the program opens the file contained in USERLOG for appending... that's what the "a" means. It returns a value in *fp* which points to the file name stored in memory. The function *fputs* places the string held in *s...* the user's name generated by *fetchnames()* a minute ago... in the next available part of the file. Finally, *fclose(fp)*; closes the file.

Further Reality

The next example, view.c, will take a disk file name as an argument and type it on the screen, pausing every twenty-four lines. This is analogous to the TYPE command in CP/M and MS-DOS. The first important thing here, however, is how to get arguments from the command line.

The form *main(argc, argv)* is the standard form for handling command line arguments in C. *argc* returns the number of arguments and *argv* the arguments themselves. These variables are declared outside the curly brackets of *main()* because C regards them as being passed parameters.

You'll probably notice a superabundance of curly brackets in this program. As we noted before, these are used to contain the code that is executed by loops and conditionals. The first set contains the code to be blasted through if the file name pointer, *in*, doesn't point to a NULL character, which would be C's way of saying that the file couldn't be found. The next one is for the following *while()* loop. This means, literally, "while you get characters in from the file pointed to by *in* and they don't equal the EOF, or end of file character, do all the stuff inside the next set of curly brackets and loop to check again". It's quite a mouthful.

The other unusual operators herein are *++* and *==*. These are not the result of keyboard bounce but, rather, are quite meaningful to C.

It's very often the case that one wants to increment or decrement a value interactively. In BASIC one normally says *X = X + 1*, or something along these lines. C allows for it by going *++x*; to increment *x* and *--x* to decrement it.

Likewise, in BASIC the equal sign operator serves both to assign and test equality. In C, testing if something is equal or unequal requires the use of a two character operator. Thus, to see if *x* equals twenty-one we would say *if (x == 21)*. The operator for inequality is *!=*.

The final example program is actually pretty straightforward. However, it's a good instance of a real world utility written in C. Much of it is specific to the QNX implementation of C. However, it's included here because it's good exercise in modifying code to suit your needs. It reads the system's clock and displays the results on your screen.

First off, we have a block of *#defines*. In fact, these are not all needed for the program... only the last one is actually used. However, they create no additional code and, in an effect to implement satisfactory amounts of programming sloth in an otherwise precise and sterile environment I usually keep this sort of stuff in a file and inhale into the program I'm working on whenever I start one.

The *get_date()* function and the code which immediately follows it returns the system's clock contents in two bytes and then cracks it apart so it can be represented in human terms. The function itself is in the QNX library... you'll probably have to write it for your system, as your implementation of C will very likely not support your clock. Likewise the cracking apart code will also want changing.

The next structure in the program is one of C's most powerful functions. The *switch()* statement allows for multiple branches depending on the contents of the variable it's testing. The *switch* also allows for a condition called *default* which it will branch to if none of the explicit conditions are met.

This program also illustrates the full use of *printf*. Immediately after the long switch structure you'll notice the line

`printf("%d, %dn", day, (year + 1980));` This means to print the string passed to `printf` substituting the values of the variable `day` for the first control string and `year` plus 1980 for the second. The control strings are the percent signs followed by characters. The string "%d" means to display the value as a decimal number. We could have said "%x", for hexadecimal or "%o" for octal. The string "%s" is also common to indicate a character string.

C For Miles

It's impossible to provide a complete tutorial on C in a single article... it's pretty tricky to handle it in human terms in a single book. C is a supremely powerful language because it gives the programmer complete control over the system. This, however, also implies that one has the responsibility to use all this control properly. C does fairly little hand holding and error checking when compared with BASIC.

C is also rotten with abbreviations and shorthand. It makes its compilations fast and its code tight... but it also calls for a lot of mental translating as you get into it.

If you begin to work with C you'll probably discover that it's wonderfully flexible and resourceful despite its largely martian syntax. It's splendid for writing large applications in as it's inherently structured and, as such, fairly easy to debug in sections. It lends itself to libraries of user written code without requiring a lot of program overhead to use 'em.

Finally, there's that glowing feeling that C gives you, the pride you'll feel in having conquered something truly nasty. If you can hack your way through the tangled vines and creepers of

C you can probably handle anything.

The fuming jaws and writhing coils await...

For further reading check out...

The C Programming Language by Brian W. Kernighan and Dennis M. Ritchie, published by Prentice Hall. This is the standard reference work on C, and serious as taxes.

C Primer Plus by Mitchell Waite, Stephen Prata and Donald Martin, published by Sams. This is a much thicker book than Kernighan and Ritchie, but much easier to get through.

The C Primer by Les Hancock and Morris Krieger, Published by McGraw Hill. This is largely a rewrite of Kernighan and Ritchie, with a bit less information and a neater cover.

Stockboy Menu

At long last, Stockboy becomes history. Don't miss this end of an era.

by Robert J. Thorne

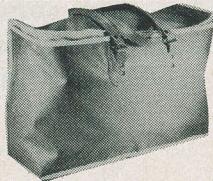

It has been said that all good things must come to an end; the Stockboy inventory control package seems to be no exception. The first four modules... inventory entry, point-of-sale, reports, and utilities... have already appeared in the December 1983, January, June, and July 1984 issues, and this final module, the main menu, serves only to tie the other three together.

Elsewhere in this issue should be the usual ad about getting this all on a disk and saving your fingers the agony of keying in all five programs. Other than that, that's all.

Soup... there are millions of cans of soup...

An Important Announcement To Advertisers and Readers of Computing Now! and Electronics Today

The October issue of Computing Now! and Electronics Today will feature the Directory of Microcomputer and Electronic Retailers in Canada.

This semi-annual update will not only supply name, address and telephone listings for a combined total of over 1200 outlets but will inform readers and advertisers of the product line offered by each outlet and whether catalogues are available on request.

For advertisers, these issues offer a special opportunity to display their message to not only the thousands of regular readers of Electronics Today and Computing Now! from coast-to-coast but also the many additional readers and companies who purchase these special issues for permanent record and for distribution to staff. For readers, there is the opportunity to find out about the many new outlets that have surfaced since the last update.

Additional copies of these issues will be available on a bulk copy basis and orders should be forwarded now to the Circulation Manager of each publication. For advertising space reservations contact should be made immediately with Omar Vogt, Rick May, or Claire Zybistski at (416) 423-3262. Time is of the essence to avoid disappointment.

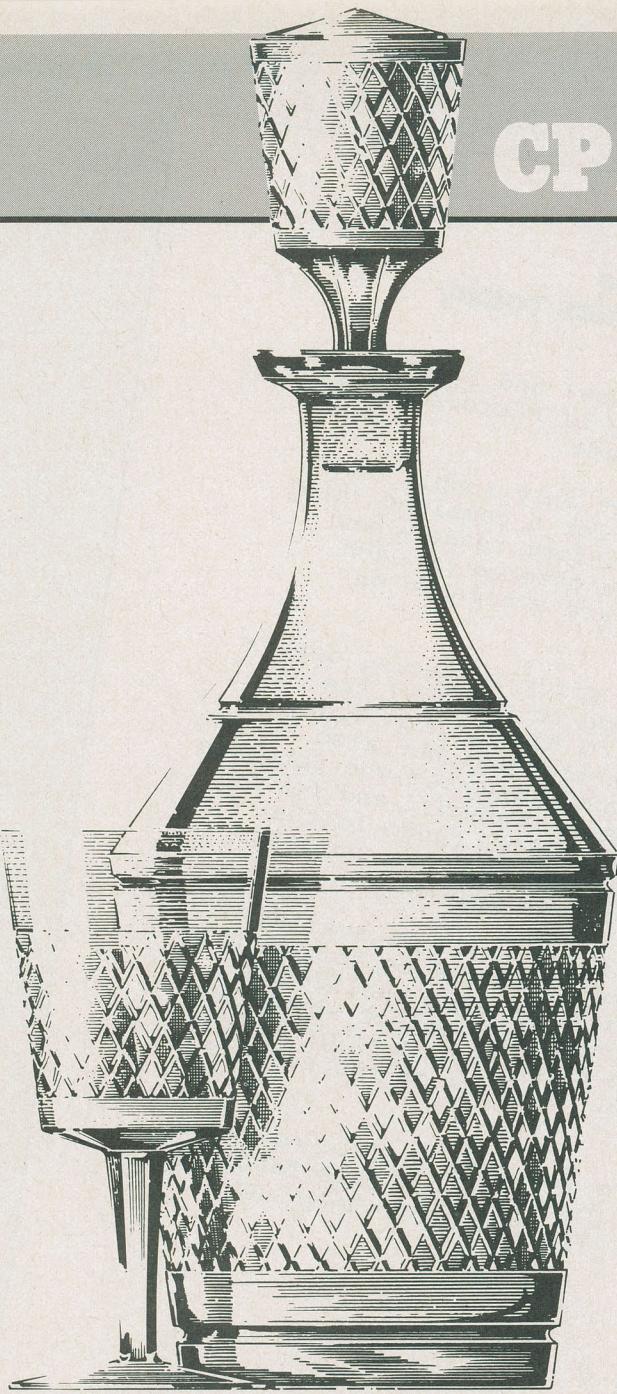

Moorshead Publications are proud to be able to serve the computer and electronics fields in this fashion. We thank the outlets involved for their help and co-operation.

Sincerely,

Halvor Moorshead.

Halvor W. Moorshead,
Publisher

Having more than one user on your single user micro... without a lot of squabbling over who gets to sit where... is a challenge. Vanquishing the foe is a job for the CP/M Host program. Check out the code... and the banners waving in the breeze.

by Steve Rimmer

I really love the idea of local area networks and multi user systems. They get over a number of the hassles inherent in microcomputers. We could use 'em here... it would save quite a number of people the daily strain of walking around with disks in their hands and stunned looks on their faces as they quest for drives. The computer typesetter wouldn't have to be run through an Apple clone and it might even be possible to save the three or four hapless victims of paper avalanches that leave the place feet first each year.

CP/M's Good Host

Death by memos is a horrible fate.

In a more enlightened sense, having more than one user for a computer allows multiple humans to access the same data or the same software without a lot of desk shuffling. Now, LANs are great for this... but they are a tad expensive. A local area network, even a modest one, can cost considerably more than the hardware it interconnects.

This is not to say that the green eyed little gaffers aren't worth every cent of what they cost. However, in many cases even a small LAN is more than one needs. A lot can be done to make one's available computer power more accessible by simply hanging a second terminal off the machine.

The CP/M Host program we're going to be looking at after this introduction winds down in a paragraph or two is a fairly sophisticated bit of code which interfaces an external terminal though your computer's serial port to the operating system's BIOS. To revert to crude English for a moment, it makes your computer think that it's talking to its keyboard and screen when, in fact, it's conversing with both the local hardware and the terminal.

Someone parked in front of the terminal, be it across the room or on the other side of the building, can operate the computer as if he, she, or it were right there staring it in the face.

While this is not as good as a LAN or a multi user system, it is powerful. To be sure, users of this type of arrangement will want to make sure that two sets of fingers don't go dancing over the keys at the same time. However, in many cases it will solve the need for the computer to be in two places at once. It also might save you some walking.

Interfacing a robot arm to the thing to allow you to change disks from far away will, of course, have to be left to the individual programmer.

Ramblin' Code

The program in listing one is the source for the whole Host system. It looks wicked, and with good reason. This is a really heavy example of that sloe eyed gremlin we have encountered on past occasions, relocating code.

If you haven't had the pleasure an introduction may be in order. Relocating code is a bunch of bytes which are assembled so as to have all their fixed addresses point to somewhere else. To look at this another way, consider this program.

ORG	0100H
MVI	C.9
LXI	D.ADDR
CALL	BDOS
RET	
ADDR	DB
END	'Cats do not fly well\$'

This will load and run at 0100H, like most programs. Now check out this one.

ORG	0F000H
MVI	C.9
LXI	D.ADDR
CALL	BDOS
RET	
ADDR	DB
END	'Unless you throw them\$'

Actually, this is a trick question. This won't even load because the linker will want to create a massive COM file stretching up to F000H, which, of course will not fit in memory and very possibly not on your disk, as well.

Now, the Host does have to live up in high memory. If we were to assemble it like regular code down at the bottom of the TPA and then just move it it would try to jump back down to where it was assembled to go. Since the Host is intended to run behind other applications this would result in some really mind warping crashes.

The solution to this is to write code that assembles to live in the TPA but with addresses that point up into high memory. It's possible to fool the assembler into doing this if you write the labels of the form

LABEL EQU \$+OFFSET

as is done in the Host source.

Code thus assembled can be moved into place. Relocating programs usually take the form of a block of relocatable code and a mover... MOVE in this case. The Host also requires a routine to fool CP/M into thinking that the implant is part of it, called RESVEC here.

Up On High

Having seen how the Host code is toolled about let us now consider what it does.

Whenever a piece of software wants to, say, get a character from the keyboard it does a BDOS call. The BDOS, in turn, looks up what is called the BIOS jump table. As we've seen in past issues of Computing Now!, the beginning of the BIOS jump table can always be found by looking at location zero of the system's memory. This contains a JMP to the base of the table. The entries are always in the same order, so the BDOS... and any other software that cares to mess with it... knows how to get a character. It simply calls the appropriate BIOS table jump.

In order to implement the Host what we need to do is to make the computer look to both the keyboard and the serial port whenever it decides to troll for characters. Furthermore, it has to do this dual input for both system commands and for applications software. As such, the BIOS jump table will want altering.

Breaking the process down even further, we want to add an extra step in processing the BIOS call to get a character. Instead of simply going and looking for keyboard status we want to look for serial status too. As such, we must alter the jump in the BIOS table to point to some new code that handles these two functions and then gets a character from whichever source happens to have one.

This code, of course, is the part of the host that scrambles up into high memory. It lives above the TPA where it can't be overwritten by transient programs. We'll get to likely homes for it presently. When you run Host the mover moves it and the patcher alters the jump table so that calls for console status, input and output go to it, rather than to the real BIOS routines.

The Host will call the real BIOS routines as it needs them.

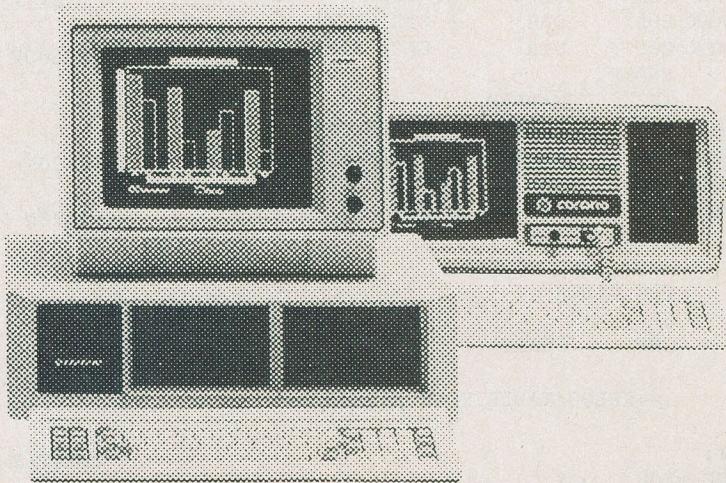

In fact, to make system programming easier, the Host maintains a sort of BIOS jump table of its own. This does not offer the same functions as the real BIOS, which is

still active for disk I/O and other peripheral communications. Rather, the *mini BIOS* allows programmers access to the facilities of the Host code for utility programs that work with both the local and the remote terminal.

The mini BIOS intercepts the vectors for the console status, input and output calls,

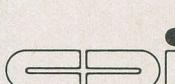

with the console status being the first. Thus, the mini BIOS can be located by a program by finding the location of the real BIOS, this being, in fact, the warm boot vector, and moving up three locations to the console status vector. This will point to the start of the Host code after HOST.COM has been run.

Getting On Line

The facilities of Host are fairly powerful. It ties the two consoles together. However, it also allows either console to shut off the remote connection. The local console can re-establish it thereafter. There are routines built in to handle printing to both consoles or to either one of them. Their use is illustrated in the main program shortly after START. They are inline printing routines, that is, you use them like

```
CALL PRINT
DB 'Cats also swim poorly'.0
```

The routine will print the string up to the null, with the program resuming execution on the following instruction. It looks weird but it works.

Most of this fancy I/O is handled through the host configuration bytes immediately after the mini BIOS. Again, these are always in the same place in relation to the start of the Host code and can be located programmatically to permit altering them.

Understanding the host bytes will probably serve to explain what the rest of the host code is for.

The TERMON byte is set to FF to activate the remote console. As with all the bytes, it is shown in a default state in the source and can be changed using the appropriate utilities after the code is active. If you want the Host come up in an inactive state, and then be activated at a later time, change this byte to 00 in the source.

SENDNUL is a fudge included for slow terminals and Apples used as terminals. It's quite possible to run the host at ninety-six baud under many systems, resulting in a remote console that's every bit as fast as your local one. Some terminals, however, are a bit sleazy when they encounter carriage returns and will lose a few characters at the beginning of each line as a result.

The solution to this is to send a number of nulls after each carriage return... pad characters which don't print and can be safely gobbled by the system. The number of nulls sent, held in NUM-NULS, should be sufficient to ensure a suitable delay but not so large as to slow down the system. This is best done experimentally... get the Host up and running and use DDT to change this byte in the relocated code until you don't lose any data.

Start The Party

Getting the Host on line is fairly straightforward. There are a few things that will have to be altered to suit your system and requirements... all of which are nestled in the equates at the top of the program.

To begin with, you must set either PORTED or MAPPED to YES... but not both. Most CP/M systems are ported. The exception to this is the Apple.

Next, set the four serial port equates to suit your computer. The code is presently set up so that the ported equates relate to port B of a TRS-80 Model II under Lifeboat CP/M and the mapped equates are for a PDA 232C serial card in slot two of an Apple. These have to reflect your hardware or nothing much will happen. Obviously, if you have made the code ported you can ignore the mapped equates.

Change SPEED to reflect your clock speed... or that of your computer... and, finally, set DEST to point to a hole for Host to live in. This last bit is the trickiest.

Host has to go somewhere above CP/M where it won't get hassled by other code. The easiest way is to create some blank RAM above the operating system by using MOVCPM to create an artificially small system. However, this is a small waste of memory and inconvenient. It's also not always necessary.

The equate given for DEST here points to a hole in my CP/M. This is a little patch of memory within CP/M which isn't used... despite the size of the source, Host is actually quite tiny. It can often be relocated into someplace out of the way.

In trolling for holes the best approach is to use DDT to locate your BIOS and look immediately beneath this. As things very seldom match up on even page boundaries it's not uncommon to find three or four hundred spare bytes in here.

The Host system is a really flexible, easily implemented remote console program. While it is shown here as dealing with a single console it's worth noting that it has been distilled down from a larger package which I wrote to handle several. There is relatively little hassle involved in having it talk to three or four.

While making the Host into a fully implemented LAN is a bit impractical... one terminal going off line tends to hang the whole ring... it does lend itself to extending the power of a single micro quite substantially. If you aren't quite ready to spring for something that comes with its own private consultant channel to it as a standard feature you might find the host to be a reasonable interim solution.

As a side benefit, the package is ideal for convincing your less technically oriented acquaintances that your computer has been taken over by dreaded evil spirits. Simply install Host, boot Wordstar and start typing something mystic on the terminal. Messages from the great beyond, communications from the dead... or the Frigid Pink or any of a number of acid bands... invasion orders from deep space... there's no limit to what these few bytes of code can coze into the minds of the gullible with a bit of finesse.

CN!

THE RESET SWITCH THAT COMMODORE FORGOT

"THE LITTLE BLACK BOX" reset switch restarts your computer without turning the power off.

YOU CAN NOW SAVE AND RETRIEVE ALL YOUR CRASHED PROGRAMS.

Saves hours of work in retyping your program.

Saves wear and tear on your computer and your nerves.

Full Lifetime Warranty Diode Protected Circuitry

To install, simply turn off computer, locate user port on left side rear, then simply insert "THE LITTLE BLACK BOX" fully in opening with the button facing up.

Turn on the computer, you've done it!!!!!!

When your computer crashes, simply press the little black button and you have recovered your lost program.

Computing Now! Bookshelf

Best Seller List from the Computing Now! Bookshelf

1

THE BASIC CONVERSIONS HANDBOOK FOR APPLE, TRS-80, AND PET USERS BRAIN BANK

HB17

\$14.50

Convert a BASIC program for the TRS-80, Apple II, or PET to the form of BASIC used by any other one of those machines. This is a complete guide to converting Apple II and PET PROGRAMS TO TRS-80 and PET programs to Apple II, TRS-80 and Apple II programs to PET. Equivalent commands are listed for TRS-80 BASIC (Model I, Level II), Applesoft BASIC and PET BASIC, as well as variations for the TRS-80 Model III and Apple Integer BASIC.

2

HOW TO TROUBLESHOOT AND REPAIR MICROCOMPUTERS

AB013

\$12.95

Learn how to find the cause of a problem or malfunction in the central or peripheral unit of any microcomputer and then repair it. The tips and techniques in the guide can be applied to any equipment that uses the microprocessor as the primary control element.

3

APPLE MACHINE LANGUAGE PROGRAMMING

AB009

\$19.95

The best way to learn machine language programming the Apple II in no time at all. The book combines colour, graphics, and sound generation together with clear cut demonstrations to help the user learn quickly and effectively.

4

BP-109: THE ART OF PROGRAMMING THE 1K ZX81 M. JAMES and S.M. GEE

\$7.60

This book shows you how to use the features of the ZX81 in programs that fit into the 1K machine and are still fun to use. Chapter Two explains the random number generator and uses it to simulate coin tossing and dice throwing and to play pontoon. Chapter Three shows the patterns you can display using the ZX81's graphics. It's animated graphics capabilities, explored in Chapter Four, have lots of potential for use in games of skill, such as Lunar Lander and Cannonball which are given as complete programs. Chapter Five explains PEEK and POKE and uses them to display large characters. The ZX81's timer is explained in Chapter Six and used for a digital clock, a chess clock and a reaction time game. Chapter Seven is about handling character strings and includes three more ready-to-run program — Hangman, Coded Messages and a number guessing game. In Chapter Eight there are extra programming hints to help you get even more out of your 1K ZX81.

5

SB21862-APPLE® INTERFACING

\$16.95

Describes the internal Apple II control signals available for I/O interfacing and shows you how to use them with Applesoft BASIC to control devices and communicate with other computers, modems, serial printers, and more. Furnishes real, tested interfacing circuits that work, plus complete breadboarding to help you check out your own interfacing ideas.

6

DESIGNING MICROCOMPUTER SYSTEMS

HB18:

\$18.95

POOCH AND CHATTERGY

This book provides both hobbyists and electronic engineers with the background information necessary to build microcomputer systems. It discusses the hardware aspects of microcomputer systems. Timing devices are provided to explain sequences of operation in detail. Then, the book goes on to describe three of the most popular microcomputer families: the Intel 8080, Zilog Z-80, and Motorola 6800. Also covered are designs of interfaces for peripheral devices, and information on building microcomputer systems from kits.

7

SB21846: ENHANCING YOUR APPLE® II — VOLUME 1

\$25.50

Who but Mother Nature or Don Lancaster could successfully enhance an Apple? YOU can, with help from Volume 1 in Don's newest series for Sams. Among other things, you'll learn (1) to mix text, LORES, and HIRES together anywhere on the screen in any combination, (2) how to make a one-wire modification that will open up whole new worlds of 3-D graphics and other special effects, plus (3) a fast and easy way to tear apart and understand somebody else's machine language program. Other goodies abound!

8

BP86: AN INTRODUCTION TO BASIC PROGRAMMING TECHNIQUES

\$7.75

This book is based on the author's own experience in learning BASIC and in helping others, mostly beginners, to program and understand the language. Also included are a program library containing various programs. Also included are a program library containing various programs, that the author has actually written and run. These are for biorhythms, plotting a graph of Y against X, standard deviation, regression, generating a musical note sequence and a card game. The book is complemented by a number of appendices which include test questions and answers on each chapter and a glossary.

9

PH131: ZAP! POW! BOOM!

ARCADE GAMES FOR THE VIC 20

T-HARTNELL & M. RAMSHAW (1983)

\$16.95

Move through the maze eating dots with MAZEMAN. Sail through space zapping the ASTROIDS. Outshoot the fastest draw in town GUNFIGHT. Owners of the VIC 20 can now play these games — and more — simply by following the programs outlined in this handy guide.

10

SB21959: THE APPLE® II CIRCUIT

DESCRIPTION

\$32.50

Provides you with a detailed circuit description of the Apple II motherboard, including the keyboard and power supply. Comes complete with timing diagrams for major signals and discussion of differences between the various revisions. Good for technicians, serious hobbyists, and others with some knowledge of digital hardware.

to a block of RAM that holds code or text the upper characters will generally print up as blocks of random dots.

A character is defined as being eight rows of eight dots each. This is a bit tricky. In fact, for the convenience of the hardware it is taken as eight eight bit bytes stacked one on top of the other. The character A is

0	0	0	0	0	0	0	0	00
0	0	1	1	1	0	0	0	60
0	1	0	0	0	0	1	0	66
0	1	0	0	0	0	1	0	66
0	1	1	1	1	1	0	0	126
0	1	0	0	0	0	1	0	66
0	1	0	0	0	0	1	0	66
0	1	0	0	0	0	1	0	66

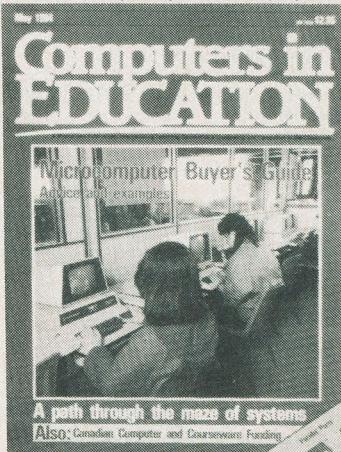

The ones represent pixels that are on. Each horizontal row can be represented as a byte. The first byte... starting from the top... holds the value of zero. The next one holds the value two to the two plus two to the three plus two to the four plus two to the five, or sixty. This is derived from taking two to the power of each bit that is on and adding the resultant mess up.

As such, eight locations of RAM can be used to define a character. Keep in mind that this has nothing particularly to do with the ASCII value of the character. These numbers simply define the shape of the symbol that appears on the screen. If we plug the above eight bytes into the space defined for character one hundred and twenty-eight and then do a PRINT CHR\$(128) an A will appear. If we were to replace them with eight bytes of two hundred and fifty-five a white box would show up for the same character value.

On the other hand, the ASCII value of the character is important as a pointer into the character memory. We can specify the location of a character's pattern bytes in a block of memory as be-

Computers in EDUCATION

A Moorshead Publication, Incorporating Teaching Electronics & Computing and Computers in the Classroom.

A path through the maze of systems
Also: Canadian Computer and Courseware Funding

Computers in Education is Canada's magazine for the teacher or others involved with microcomputing, and comes from Moorshead Publications, the publishers who became industry leaders with Electronics Today, Computing Now!, and soon Software Now!.

There are news articles on the latest events and technology, beginner's guides to languages and software, software and book reviews, build-it-yourself projects, technical tips, and more.

In recent issues, for instance, Computers in Education covered the Icon educational computer and user's reactions to it, Logo, word processing for the classroom, simple cures for hardware problems, how disk systems work, a BASIC tutorial, and more.

YES, I want to subscribe!

Computing Now! Bookshelf

BEGINNERS

BP115: THE PRE-COMPUTER BOOK

\$7.60

Aimed at the absolute beginner with no knowledge of computing, this entirely non-technical discussion of computer bits and pieces and programming is written mainly for those who do not possess a microcomputer but either intend to one day own one or simply wish to know something about them.

A CONSUMER'S GUIDE TO PERSONAL COMPUTING AND MICROCOMPUTERS, SECOND EDITION

FREIBERGER AND CHEW

HB14

\$15.95

The first edition was chosen by Library Journal as one of the 100 outstanding sci-tech books of 1978. Now, there's an updated second edition!

Besides offering an introduction to the principles of microcomputers that assumes no previous knowledge on the reader's part, this second edition updates prices, the latest developments in microcomputer technology, and a review of over 100 microcomputer products from over 60 manufacturers.

THE ESSENTIAL COMPUTER DICTIONARY AND SPELLER

AB011

\$9.95

A must for anyone just starting out in the field of computing, be they a businessman, hobbyist or budding computerist. The book presents and defines over 15,000 computer terms and acronyms and makes for great browsing.

BEGINNER'S GUIDE TO COMPUTER PROGRAMMING

TAB No.574

\$15.95

Computer programming is an increasingly attractive field to the individual, however many people seem to overlook it as a career. The material in this book has been developed in a logical sequence, from the basic steps to machine language.

HB131: THE BEGINNER'S GUIDE TO BUYING A PERSONAL COMPUTER

\$5.95

Written for the potentially interested computer buyer, in non-technical language, this affordable book explains the terminology of personal computers, the problems and variables to be discussed and discovered while making that initial buying decision. The book does not make recommendations, but does present a great deal of information about the range of hardware available from the largest personal computing manufacturers. Readers discover the meaning and impact of screen displays, tape cassette storage and disk storage, graphics and resolution, and much more. Comparison charts clearly define standard and optional features of all the current mass market personal computers.

MICRO- PROCESSORS

A BEGINNER'S GUIDE TO COMPUTERS AND MICROPROCESSORS — WITH PROJECTS.

TAB No.1015

\$13.95

Here's a plain English introduction to the world of microcomputers — its capabilities, parts and functions . . . and how you can use one. Numerous projects demonstrate operating principles and lead to the construction of an actual working computer capable of performing many useful functions.

BP66: BEGINNERS GUIDE TO MICROPROCESSORS AND COMPUTING

\$7.50

E.F. SCOTT, M.Sc., C.Eng.

As indicated by the title, this book is intended as an introduction to the basic theory and concepts of binary arithmetic, microprocessor operation and machine language programming.

There are occasions in the text where some background information might be helpful and a Glossary is included at the end of the book.

BP72: A MICROPROCESSOR PRIMER

\$7.70

E.A. PARK, B.Sc., C.Eng., M.I.E.E.

A newcomer to electronics tends to be overwhelmed when first confronted with articles or books on microprocessors. In an attempt to give a painless approach to computing, this small book will start by designing a simple computer and because of its simplicity and logical structure, the language is hopefully easy to learn and understand. In this way, such ideas as Relative Addressing, Index Registers etc. will be developed and it is hoped that these will be seen as logical progressions rather than arbitrary things to be accepted but not understood.

HANDBOOK OF MICROPROCESSOR APPLICATIONS

\$15.95

Highly recommended reading for those who are interested in microprocessors as a means of accomplishing a specific task. The author discusses two individual microprocessors, the 1802 and the 6800, and how they can be put to use in real world applications.

BP102: THE 6809 COMPANION

\$7.60

M. JAMES

The 6809 microprocessor's history, architecture, addressing modes and the instruction set (fully commented) are covered. In addition there are chapters on converting programs from the 6800, programming style, interrupt handling and about the 6809 hardware and software available.

SB1877: MICROPROCESSOR CIRCUITS, VOLUME 1: FUNDAMENTALS AND MICROCONTROLLERS \$13.95
Intended for service technicians, computer technicians, industrial control personnel, students, hams, and others who need to learn microprocessor basics. Brings you a chance to learn microprocessor theory and gain valuable practical experience at the same time! Excellent for home study and in-plant training. Features actual demonstration circuits easily built with solderless boards and readily available chips and parts.

AN INTRODUCTION TO MICROPROCESSORS EXPERIMENTS IN DIGITAL TECHNOLOGY

HB07:

SMITH

\$18.95

A "learn by doing" guide to the use of integrated circuits provides a foundation for the underlying hardware actions of programming statements. Emphasis is placed on how digital circuitry compares with analog circuitry. Begins with the simplest gates and timers, then introduces the fundamental parts of ICs, detailing the benefits and pitfalls of major IC families, and continues with coverage of the ultimate in integrated complexity — the microprocessor.

DIGITAL INTERFACING WITH AN ANALOG WORLD

TAB No.1070

You've bought a computer, but now you can't make it do anything useful. This book will tell you how to convert real world quantities such as temperature, pressure, force and so on into binary representation.

MICROPROCESSOR INTERFACING HANDBOOK: A/D & D/A

TAB No.1271

A useful handbook for computerists interested in using their machines in linear applications. Topics discussed include voltage references, op-amps for data conversion, analogue switching and multiplexing and more.

BASIC

BASIC COMPUTER PROGRAMS IN SCIENCE AND ENGINEERING

GILDER

HB08

\$15.95

Save time and money with this collection of 114 ready-to-run BASIC programs for the hobbyist and engineer. There are programs to do such statistical operations as means, standard deviation, averages, curve-fitting, and interpolation. There are programs that design antennas, filters, attenuators, matching networks, plotting, and histogram programs.

SB22047: 26 BASIC PROGRAMS FOR YOUR MICRO

\$16.95

Features 26 previously unpublished, simple-to-complex games you can run on almost any brand of microcomputer as long as you have enough RAM on board. Most take between 500 and 5000 bytes, with the highest taking 13K. Conversion charts that let you key them into your Radio Shack, TRS-80, Apple II, Timex/Sinclair 1000 (ZX81), Spectrum, Atari, or PET are included. Also features notes on program techniques and structures.

Tab1533: GRAPHICS PROGRAM IN MICROSOFT BASIC

\$19.25

Generate computer art including mathematically defined art and animated graphics; draw still pictures — realistic and abstract; create an interactive space shuttle simulation; plot architectural and landscape drawings with both high and low resolution graphics; construct a 3-dimensional model of a function; plot 2-dimensional graphics, statistical relations, maps and diagrams. All these are written in Microsoft BASIC that is adaptable to just about any BASIC micro system.

THE MOST POPULAR SUBROUTINES IN BASIC

TAB No.1050

\$10.95

An understandable guide to BASIC subroutines which enables the reader to avoid tedium, economise on computer time and makes programs run faster. It is a practical rather than a theoretical manual.

COMPUTER PROGRAMS IN BASIC

AB001

\$14.95

A catalogue of over 1,600 fully indexed BASIC computer programs with applications in Business, Math, Games and more. This book lists available software, what it does, where to get it, and how to adapt it to your machine.

THE BASIC COOKBOOK.

TAB No.1055

\$9.95

BASIC is a surprisingly powerful language . . . if you understand it completely. This book, picks up where most manufacturers' documentation gives up. With it, any computer owner can develop programs to make the most out of his or her machine.

BASIC FROM THE GROUND UP

SIMON

\$19.95

Here's a BASIC text for high school students and hobbyists that explores computers and the BASIC language in a simple direct way, without relying on a heavy mathematical background on the reader's part. All the features of BASIC are included as well as some of the inside workings of a computer. The book covers one version of each of the BASIC statements and points out some of the variations, leaving readers well prepared to write programs in any version they encounter. A selection of exercises and six worked out problems round out the reader's experience. A glossary and a summary of BASIC statements are included at the end of the book for quick reference.

MISCELLANEOUS

Z-80 AND 8080 ASSEMBLY LANGUAGE PROGRAMMING

SPRACKLEN

\$18.95

Provides just about everything the applications programmer needs to know for Z-80 and 8080 processors. Programming techniques are presented along with the instructions. Exercises and answers included with each chapter.

Tab 1389: MACHINE AND ASSEMBLY LANGUAGE PROGRAMMING

\$14.95

This book assumes no prior programming knowledge and starts by explaining the advantages of ML. Several sample programs are included and each chapter ends with a quiz to check your understanding of that section.

SARGON: A COMPUTER CHESS PROGRAM

SPRACKLEN

\$27.50

"I must rate this chess program an excellent buy for anyone who loves the game." Kilobaud.

Here is the computer chess program that won first place in the first chess tournament at the 1978 West Coast Computer Faire. It is written in Z-80 assembly language, using the TDL macro assembler. It comes complete with block diagram and sample printouts.

PH180: 1983 CANADIAN BUSINESS GUIDE TO MICRO-COMPUTERS

\$11.95

Written by the managing director of Deloitte, Haskins & Sells, a Canadian partnership of public accountants and other professional advisors to management, this book is one of the most complete comprehensive guides to microcomputers available. Starting with a general overview of microcomputers and their business applications, the author helps you assess your computer needs, compares and evaluates computer systems and application packages, and gives you tips on "doing it right". A must for anyone thinking of purchasing a microcomputer for business.

HOW TO PROFIT FROM YOUR PERSONAL COMPUTER: PROFESSIONAL, BUSINESS, AND HOME APPLICATIONS

LEWIS

\$18.95

Describes the uses of personal computers in common business applications, such as accounting, managing, inventory, sorting mailing lists, and many others. The discussion includes terms, notations, and techniques commonly used by programmers. A full glossary of terms.

PH181: THE DATA BASE GUIDE

C.BENTON

\$26.00

Complete step-by-step book detailing the necessary elements for selecting organizing and implementing database systems for microcomputers. Presents material at a beginner's level yet thorough enough to aid the professional data processing person.

BUSINESS

PH203: THE POWER OF MULTIPLEX™ MANAGEMENT INFORMATION SOURCE

\$19.95

Covers Accounts receivable, invoicing, cost recovery production scheduling estimating, checkbook, and engineering problem solving accounts payable, payroll, monthly sales report, inventory and financial forecast.

PH206: dBASE II USER'S GUIDE

A. GREEN

\$38.00

This instructional handbook for novices and experienced users alike presents a simple, highly effective approach to learning how to use this powerful software program available for microcomputers.

BASIC COMPUTER PROGRAMS FOR BUSINESS: STERNBERG (Vol. 1)

\$21.50

A must for small businesses utilizing micros as well as for entrepreneurs, volume provides a wealth of practical business applications. Each program is documented with a description of its functions and operation, a listing in BASIC, a symbol table, sample data, and one or more samples.

GENERAL

S-100 BUS HANDBOOK

BURSKY

\$25.50

Here is a comprehensive book that exclusively discusses S-100 bus computer systems and how they are organized. The book covers computer fundamentals, basic electronics, and the parts of the computer. Individual chapters discuss the CPU, memory, input/output, bulk-memory devices, and specialized peripheral controllers. It explains all the operating details of commonly available S-100 systems. Schematic drawings.

See Order Form on page 88

Software Now!

First Issue October 1984

A New Canadian Publication for the Ultimate Medium

The difference between we humans and the other inhabitants of the planet is our capacity for making tools. Civilization is often measured by its grasp of technology . . . it's through his use of tools that man has come to be able to manipulate his environment.

The computer is the ultimate tool . . . it is, like man himself, unspecific, and thus adaptable to virtually any task. The same computer can be a bookkeeper, a game, an artist's palette, a composer's amanuensis, a word processor or a programmer's development station.

The computer itself is simply a box full of chips. The power of computers lies in the software that runs on them.

Software Now! is the new magazine for people harnessing the power of the microcomputer. In its pages you will find the information which you will need to choose and apply the software that will dedicate your computer to your tasks. It will help you make sense of the myriad of similar software packages, translate the intricate complexities of software claims, understand the watershed breakthroughs in software development . . . and even have a bit of time left over to dematerialize a few aliens.

Perhaps most exciting, however, is that the pages of **Software Now!** will contain news about software for applications you've never even considered running on your computer. Imagine having an overview of the work of the world's most gifted program developers . . . and you'll have a good idea as to what this new publication is about.

The Amazing Software Now! Software Disk Free to Charter Subscribers

At Moorshead Publications, we have always managed to launch new magazines with a flying start; this time we want our previous records to be smashed. We believe we have come up with "an offer you can't refuse".

The **Amazing Software Now! Program Disk** is, we believe, the best offer ever made to Charter Subscribers to a new magazine. A charter subscriber is one who helps provide the initial circulation base and we feel they deserve something special — what we are offering is just that.

The disk contains some fairly amazing custom written material:

CalcNow: A real spreadsheet program with many of the new features of programmes costing a small fortune. CalcNow is perfect for those who want to experiment with a spreadsheet and are dying to see how they work. It is far from a toy.

DataBox: A flexible data base manager and is a version of a program we developed for our own company use.

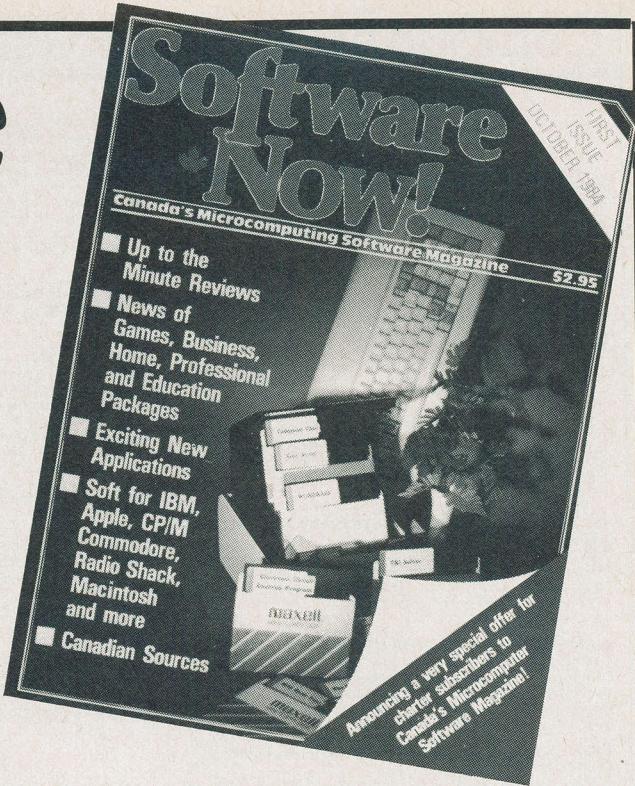

Poker: Life is not complete without a video game.

Phone Jack: A telecommunications terminal.

The contents of the disks vary depending on the system and additional programs come for some systems: see overleaf for a more complete description.

The **Software Now! Disk** is available in a huge number of different formats but we haven't forgotten you if you haven't got a disk drive or a system that we can accommodate: everyone will also receive a hard copy listing of those programs written in BASIC (listed for Microsoft Basic for you to modify yourself).

This disk will be sent to you **FREE** if we get your subscription order **before September 30th, 1984**. Early orders will get their disks as soon as processing and shipping time allow, later orders will receive them with the first copy of the magazine.

Software Now! will be dealing with a broad range of systems and applications, encompassing eight, sixteen and thirty-two bit machines and software as diverse as video games, drafting systems and spreadsheets.

We've reached a level of development in microcomputer software wherein one needn't be a computer genius to apply a computer. In fact, one can operate a computer with only a bit more expertise than one needs to successfully make toast. The key that will unlock the power of your computer is the software you plug into it.

The key to that software is understanding.

The key to understanding software is Software Now!

The **Software Now! Disk** is not available at this time **EXCEPT to Software Now! Charter Subscribers**. The software is currently in the final stages of development but we must reserve the right to modify the content.

Software Now! is available at a charter rate of **\$19.95** for a one year subscription, **\$34.95** for two years. This rate is valid until September 30th, 1984. This rate includes your choice of a **free software disk** . . . please specify the machine operating system and format you want the disk to run with: check those available.

YOUR GUARANTEE

If you do decide that Software Now! is not the magazine you expected or want, or if you decide to cancel your subscription for any reason or no reason, you may do so and receive a refund on the unexpired portion at any time.

If, however, you cancel before receiving your THIRD issue, we will issue a complete refund. Charter Subscribers receiving the Software Disk as part of their subscription will have just \$3.00 deducted for the raw cost of the disk.

This guarantee is backed by the full resources of Moorshead Publications. Any refund will be made promptly and cheerfully.

H.W. Moorshead
President

CalcNow

CalcNow is a fully capable spreadsheet package. It can manage a sheet sixteen columns across by twenty six rows deep. It allows for automatic and manual recalculation, full cursor movement, formulae, constants and labels, disk storage of your sheets and a full hard copy reporting function. Its syntax and behavior is very much like that of the popular packages and for models of the size usually used in small business and personal financial planning it's equivalent to professional . . . and very much more expensive . . . spreadsheet packages.

Phone Jack

Most computers have telecommunications hardware built into them . . . it's a shame that they don't all have software available to drive it. This program does basic telecommunications and, while its features do vary a bit from system to system . . . based on what the operating systems allowed us to implement . . . it does provide for the basic requirements of calling computer bulletin boards and dial up mainframes.

Utility Pack

Most revisions of the disk will also have a choice selection of utility programs. These vary a lot from system to system so it's a bit difficult to describe them all here. However, these are the little routines that make life so much easier when you sit down at the keyboard and switch on.

DataBox

Many commercial data base managers are extremely powerful, extremely expensive and, in fact, grossly over qualified for most tasks. DataBox can handle most of their routine tasks that data base managers are bought for. It is efficient of disk space, reasonably fast and very, very flexible. It can keep track of your files, your stock . . . or even your record collection. It features variable fields, hard copy reporting and flexible search parameters.

These programs will vary a bit from system to system . . . the following outlines the formats in which we can supply this software. You will need your own Microsoft compatible suitable BASIC Interpreter (e.g. GWBASIC, BASIC-80, MBASIC, APPLESOFT, RS BASIC, PET BASIC, Microsoft Macintosh BASIC etc.)

For CP/M* users: CalcNow, DataBox, Poker!, Utility Pack, Phone Jack

For Apple II + DOS Users: CalcNow, Databox, Poker!, Phone Jack, Utility Pack plus Clef Hanger (An Apple Music Box), Skyhook (a teletype converter) and Fruit Crate (a BBS).

For IBM Users: CalcNow, Databox, Poker!, Utility Pack, Phone Jack plus Bandit (A slot machine simulator)

For Macintosh Users: CalcNow, Databox, Poker, Phone Jack and Letterhead (a stationary generator).

For Commodore Users: CalcNow, Databox, Poker, Utility Pack and Phone Jack.

For TRS-80 Model III and 4: CalcNow, Databox, Poker

Poker!

We wanted to include a game on the disk and, after some deliberation decided that a good dimly lit, smokey card game would fill the bill best. This one simulates five card draw poker in the proper cowboy style. It can deal, draw, call, bet . . . do everything but cheat and pull its six gun on a really bad hand. POKER! features a graphic display of the cards being played.

This software is available as a free gift to charter subscribers to Software Now! magazine. To be eligible to receive this disk your subscription order must be at our offices no later than September 30th, 1984.

* Available for Apple CP/M, Osborne single and double densities, Access Matrix, Kaypro II, Lobo max 80, Morrow Micro Decision, Olympia single and double, Superbrain, Systel/Olympia, DEC VT-180, Nelma Persona, Xerox/Cromemco, 3R Avatar, Casio FP-1000, Epson QX-10VD, Attache, Micromate, if800, Sanyo MBC 1000, Televideo, Zorba and on eight inch single sided single density disk.

I'd like to become a Charter Subscriber to Software Now! and receive my Amazing Software Now! program disk.

One year (12 issues) for \$19.95

Two years (24 issues) for \$34.95

Birth of a Hero

First there was Robot, the bubble headed ninny, zapping purple aliens by day and arguing with Doctor Smith by night. Then came the efforts of R2D2 and C3P0. Now, from the black emptiness of space to the inner reaches of your basement, you too can build your own metallic Hero.

by Dave Yule and Ed Hoornaert

The home computer had been born without us. We missed the golden opportunities open to those clever souls who got in on the ground floor. We were determined that the same thing wouldn't happen with the home robot.

Only two years ago home robots were just a gleam in hobbyists' eyes. However, in early 1983 Heathkit announced its "Hero 1" ... the *Heath Robot*. Looking vaguely like R2D2, Hero is a mobile device capable of interacting with its environment through electronic senses. The robot uses an on board microprocessor for its "brain". The optional speech synthesizer and mechanical arm make Hero one of the most versatile hobby robots to have become available to date.

The robot is available either ready made or as a kit. We chose to assemble the kit for both educational and economic reasons. The challenge of building our own robot was tempting and the price tag of just under twenty-two hundred dollars for the kit, compared to almost thirty-eight hundred for the preassembled robot made our choice obvious.

When the huge boxes arrived we soon discovered what a massive job we had undertaken. Hero is complex. We were nearly overwhelmed when we discovered that even such a basic item as the keyboard had to be bolted, soldered and snapped together from scratch.

Have you ever peeked inside an Apple at the components soldered onto the circuit

board? Try to imagine all those pieces spread out on a workbench, ready for soldering. Now imagine ten such piles of components. That's Hero prior to birth. Heath says it requires seventy hours of construction time, though twice that is not out of line.

It all sounds very scary, but we found Heath's manuals to be very thorough and easy to read. Even basic soldering techniques are covered. Needless to say, anyone who completes Hero will become an expert at soldering.

In fact, the list of tools needed is surprisingly short. Apart from a twenty five watt soldering pencil all you need are pliers, wire cutters, wire strippers, screw drivers and a crescent wrench. When we had to remove an incorrectly placed component we found a desoldering bulb to be quite useful too.

Hero's Nervous System

Hero's CPU is a Motorola 6808 chip. Though this chip is the decision maker, the CPU board has twenty-five integrated circuits altogether. Many of the others are memory chips, comprising four K of low power CMOS RAM and some ROM. The CMOS permits the system to run reliably on batteries but CMOS chips are more expensive and delicate than regular memory devices.

Because the CPU is the most complex and critical board in the robot it comes fully wired and tested even with the kit version of the project.

Hero's nervous system is the input/output board. Virtually all of the other boards exchange data with it. It was not too surprising that the I/O board took longer to solder than any other board in the kit.

The board has a bit of a catch to it. It uses seven chips with the same number, 74LS374. We mixed them up, though three were packaged separately. All 74LS374 chips would seem to be created equal. However, when we reread the directions we discovered that the three selected chips were supposed to go in critical areas of the circuit.

Heath supplied us with a new package of selected chips.

Senses

Hero's senses are too primitive to receive and act on direct communication, but if he's programmed to pay attention he can get feedback from his environment. There are four small sense boards to solder and install, but they are straightforward and quite easy to construct.

The sense board enables the robot to detect sounds and distinguish between light

and dark. There is a motion board which allows the robot to detect the movements of objects. To complete Hero's bat-like sensorial quality there are two sonar boards, one to send and another to receive ultra high pitched sounds.

As you might expect, Hero's communication skills are somewhat limited. He talks to humans through a keyboard, a cassette interface and a remote control teaching pendant.

The kindest statement one can make about the robot's screen display is that it is primitive. The LEDs on top of the case can display only six characters at a time, making it less than ideal for word processing.

Having purchased the optional speech board, our robot can talk. The Vortrax speech synthesizer is ideal for Hero. Being both mechanical sounding and a bit funky, it gives the robot much of its personality. While you can write programs to produce any combination of phonemes, Hero's ROM is preprogrammed with thirty statements. "People stare at me a lot. I suppose it's because I'm so short." and "Oh no! I do not do windows" are among its canned observations.

Programs may be entered into the robot's operating system through a hex keypad. A serial cassette port allows recorded programs to be easily saved and recalled.

The most intriguing method of programming Hero involves the teaching pendant. When its long cord is plugged into the robot, Hero operates rather like a glorified

remote control toy car. The pendant controls turning, plus three forward and reverse speeds and arm and head movement. In addition, the robot can store sequences of actions in RAM and can then repeat them without the pendant.

Locomotion

Hero goes mobile with wheels rather than legs. While some experimental robots have legs for climbing stairs or crossing rough terrain, most home robots will probably never need them.

Hero's three wheels are controlled by the main drive circuit board. The electric motors and gears in the wheel assembly seemed primitive compared to the technology used in the rest of the kit.

Arms are at the leading edge of robot technology. Most industrial robots are just one big arm, or *manipulator*. If you want to learn about robotics, Hero's optional arm is a highly recommended option. In addition to its educational possibilities it will save you having to get up in the middle of the night to scratch him if he develops an itch.

Manipulators are classified by their number of joints or axes. The human arm has seventeen axes compared to Hero's five. That's not too bad... many industrial robots have only four or five axes. One of Hero's joints allows the arm to extend and retract, rather like a turtle pulling in its head. Tiny stepping motors power the movement of each joint.

Though small, the boards controlling the arm were among the hardest to build.

The shoulder board and the wrist circuit were so crowded that some components had to be carefully soldered onto the back of the board.

Hero's pliers-like fingers lack a sense of touch. Since the robot cannot feel around for a solid grip on an object, precise positioning of the hand through programming is crucial. To add to this limitation, we found that when the robot repeats a movement several times the positioning of the arm grows more and more inaccurate each time.

Imagine Hero picking up dominoes from a box, swinging its arm around and then dropping them into another box. Hero would pick up the first domino perfectly. The second try would be a bit off target. By the fifth or sixth try the manipulator would miss the box completely. Hero would never be able to keep a job on a Ford assembly line.

Because Hero's batteries are only good for about six hours of continuous use, Heath recommends leaving Hero plugged into the charger when not he's operating. However, he has a battery saving sleep mode that provides only enough juice to maintain a program resident in the CMOS RAM chips so he can stay away from the juice for fairly prolonged periods if needs be.

Like a young child Hero occasionally decides to wake up before you expect him to. He was discovered one day bumping around down in the basement. Luckily, the robot also has an off switch, and has never managed to turn itself on.

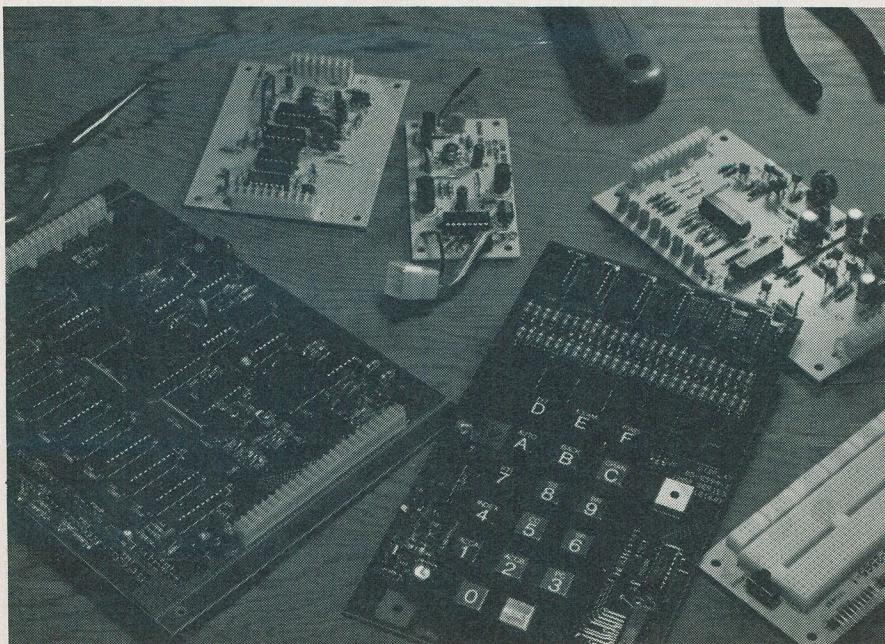

Skin and Bones

The nuts and bolts task of constructing Hero's aluminum skeleton and attaching the various subassemblies to it was not always an easy one. Some of the circuit boards were difficult to mount, especially the I/O board. Many pin connectors had to fit into holes in the skeleton. Lining up the pins and holes was frequently taxing.

Hero's head requires separate construction since it is designed to rotate. The head's being able to rotate allows the robot's sensors to scan in all directions and also facilitates use of the arm. You see, Hero's arm is attached to his head. Isn't everyone's?

It's probably true that Hero doesn't actually have kilometers of wires, but it sure seemed like it as we made up the harnesses. Many wires were short. The ends had to be stripped to precise lengths and tiny spring connectors had to be soldered to them. The connectors were fussy about fitting in the connector shells.

After so many circuit boards we were

A selection of Hero's vital organs.

Birth of a Hero

finally working on something that looked like a robot.

However, Hero has so many parts, and, as such, so many opportunities for mistakes. Before the robot could be turned on we had to run through a series of extensive checks. All the circuit board components were first checked visually to make sure they were well soldered and in their proper places. Selected pins were tested for correct resistances between the board and ground.

Following partial power up and power supply checks we wondered whether the thing was going to explode in a shower of sparks. Rather to our surprise, everything checked out. The big moment had arrived. When we flipped the switch, Hero didn't explode. Neither did it cry out like a newborn. "Ready" said the metallic voice.

The proud parents congratulated each other.

Our congratulations were perhaps a bit premature. We still had to test the robot in operation. The manual had eight short program listings that would allow us to test and adjust the robot's senses and CPU. Unlike the tests prior to powering Hero up, these were fun.

One of the first programs one runs on Hero sets the CPU's time function, turning Hero into a two thousand dollar roving digital clock. We knew the robot would be useful for something.

Programs to check out Hero's senses came next. We eagerly watched the various LEDs that indicated proper operation of the motion, light and sound detectors. Then we adjusted each board as required.

Our only problem was with the sound sensor. The LEDs kept showing that the

robot was hearing something, although the basement seemed quiet. We finally realized that upstairs, at the other end of the house, dishes were being stacked. Hero has keen ears.

The last program posed a more serious problem. The teaching pendant seemed to work since Hero rolled around on command. However, the program was supposed to display certain numbers if all was well. The numbers were wrong. We couldn't tell if the problem was in the pendant or in the program code. A call to Heath told us that the program had a bug. Fortunately, this was one of only a couple of mistakes we found in the huge manual.

The main thing was that Hero worked. All those wires, connectors, diodes, resistors, transistors, clips and chips were all in the right places doing the right things.

Teaching Hero

We realized that our young robot needed a proper education. Unfortunately, teaching Hero is a huge chore. The teaching pendant is fine for some tasks but it can't program the robot to make use of its senses. For example, the pendant can't make Hero use sonar to judge the distance remaining before it crashes into a wall.

Hero is not programmed in BASIC, Pascal, LOGO or any other common language. To program the robot you must use 6808 machine code or the equally abstruse hexadecimal robot language.

For those unacquainted with the joys of machine code, the following program makes Hero say "hello".

```
RESET
A
A
0090
72
00
95
20
FE
1B
3B
18
35
37
3F
FF
RESET
```

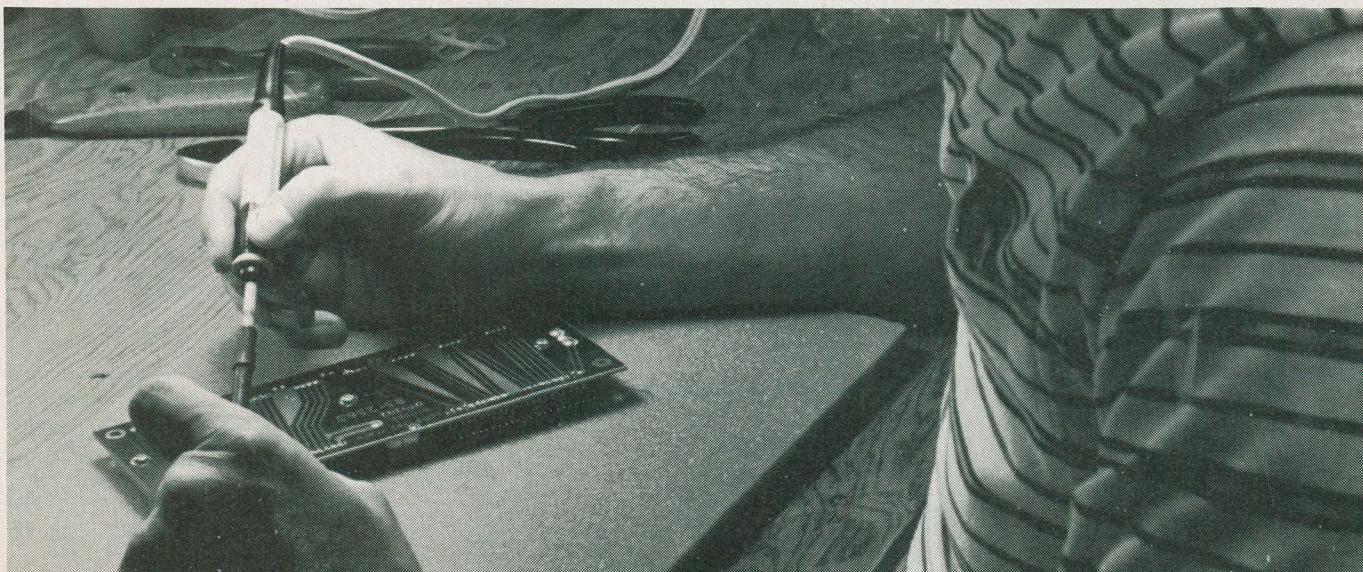

This code is a trifle more difficult to remember than *PRINT "HELLO"*. Even simple robot programs are a chore, the more so as Hero lacks all but a rudimentary editor. Complex programs pose horrendous problems. A mistake in typing or a change in the program means that the entire program must be reentered from that point on.

To program efficiently we figure we need a 6808 robot language cross assembler. This would allow one to program in 6808 assembly code. Ideally, the code could then be sent to Hero using an RS232 interface.

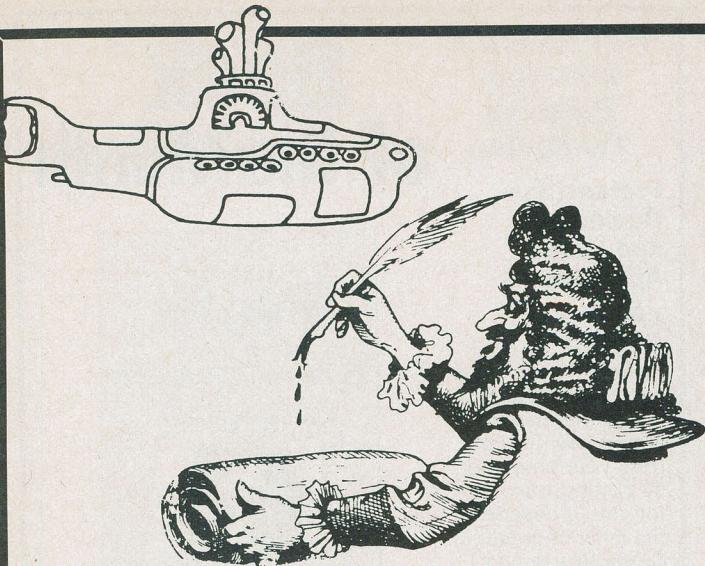

All in all, we would say that Hero is a great kit. It's time consuming to put together but fairly easy. The price is a little steep since there are no price wars or clones available. Still, it's a potent introduction to robotics, especially if you shell out another hundred and fifty dollars for Heath's eleven hundred page robotics and industrial electronics course.

Hero, my slippers please.

CN!

Soldering Hero's bits... expect to do rather a lot of this.

A large, bold, black and white graphic. On the left is a stylized, blocky number '2'. To its right is a smaller, more rounded '2'. To the right of that is the word '.COM' in a dotted, blocky font.

How to Profit from your Personal Computer

Professional, Business, and Home Applications

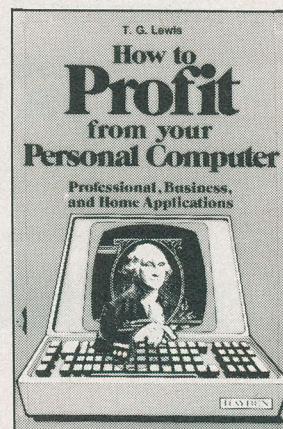

T.G. Lewis
\$18.95

Written for business people and computer hobbyists, this book shows how to profit from your computer by putting it to work for you. It describes the uses of personal computers in common business applications, such as accounting, handling payrolls, managing inventory, and sorting mailing lists. Simply written in an entertaining style, the discussion includes terms, notations, and techniques commonly used by programmers. Some of the special features are structural design of programs using blueprints, up-to-date programming methods, and a full glossary of terms. Many BASIC language programs are reproduced to illustrate the techniques for profiting from your personal computer.

Available from: Moorshead Publications 25 Overlea Blvd. Suite 601, Toronto, Ontario M4H 1B1 (416) 423-3262

Book of the Month

Computing Now! Car Ramp/Magazine Binder

It's spring again, and time to change the oil and find out what is causing that annoying rattle when the engine's idling. We know what a drag it can be, especially when your head gets stuck between the ground and the oil pan, so we are offering our incredible new Computing Now! CAR RAMPS!

Covered in black vinyl, these amazing devices not only support up to 1 kg (2.2 lb.), they also happen to hold 12 issues worth of our magazines: Electronics Today, Computing Now!, and Special editions from Moorshead Publications. The world's top inventors were hired at enormous expense to design the spring gadget that holds the magazines without cutting or punching.

Sturdily made from the finest materials, the Car Ramp/Magazine Binder offers you a lifetime or enjoyable use, unless of course you actually try to drive your car up onto them. They are available for \$9.25 each — don't forget to specify which one you would like — and Ontario residents, must add 7% Provincial Sales Tax. Order from:

GUESS WHAT'S NEW IN CANADA??!

Flexidraw

A modern alternative to Pencil and Paper

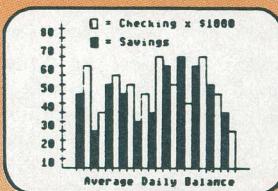

FLEXIDRAW is a versatile graphics software program coupled with a high performance light pen for the Commodore 64 Computer. The Flexidraw package enables 64 users to perform pencil and paper routines utilizing the speed and full graphic capabilities of their computer. As a result, the C-64 user can produce from simple free-hand sketches to complex CAD-type drawings.

Features:

- Light pen driven, on-screen menu with full audio/ video feedback includes these features: Line... Box... Circle... Sketch... Crosshairs... Text... Rubber band...
- Pattern fills and shading with 284 pattern choices available.
- Print drawings in two sizes.
- Two separate work screens
- Image can be easily moved, overlaid and replicated using PUT/GET commands
- Full use of upper and lower case text and all Commodore 64 graphic keys
- Full disk access from program allows you to: List directory, Format new disks, Save, load and delete screen images
- Preprogrammed templates aid in producing: Electronic schematics, Architectural floorplans, Music composition, Scientific equations
- Compatible with Micron Technology's Micron Eye digitizing camera
- Programs on disk
- 90 days warranty on disk
- 2 year warranty on light pen

This **FLEXIDRAW™** package includes: Light pen, User's manual, 5-1/4" disk, Key overlay.

2 year warranty lightpen
full 90 day warranty Flexidraw program

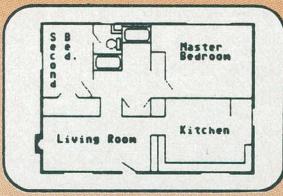

\$199.95

The applications of the Flexidraw are limited only to the user's imagination.

Want your computer to do what you tell it?

CHIRPEE™ is a "user friendly" voice recognition module for Commodore and Apple systems.

\$249.00

Chirpee is the affordable way to command a computer with the spoken word, there's no need to hold a mouse or lay a finger on a CRT screen. Chirpee can be taught to obey one person exclusively or several people. Even more impressive, Chirpee can be trained to respond to any language from English to Swahili. Chirpee has a 250 word memory capacity.

**Stack Light
Rifle**
\$99.95

The SLR is available for Commodore 64 and VIC-20 computers.

Your SLR includes 3 action-packed games with full sound effects ... High Noon, Shooting Gallery and Grouse Shoot!

For those games that require agility and fast reaction, the SLR can break down from a rifle into a pistol.

More approved game titles include: Rats & Cats, Escape From Alcatraz, Big Game Safari, & Crow Shoot.

Remote Control Freedom Fighter Joystick

\$79.95

- 90 day warranty
- Range up to 20 feet
- 1 on 1 firing ratio
- Thumb & forefinger trigger action
- Super sensitive for accurate control
- Rubber antenna safety feature
- Suction cups for tabletop use

For use with Atari, Sears, Texas Instruments 99/4A, Colecovision (with adaptor), NEC, PC601, and Commodore

COMPUTER PRESS

Computer Science Course

WATERLOO, ONTARIO — Waterloo Distance Education, Inc. has made a self-study course available to professionals, managers, teachers or other individuals unfamiliar with the language of BASIC. Consisting of 36 lectures on audio cassettes, **Structured Programming in BASIC** is accompanied by two volumes of detailed lecture notes.

Proper programming style, structured programming and program documentation are emphasized throughout the course. For those new to computers, a four lecture course, *Introduction to Computers and Computing* is included at no extra cost.

An IBM PC or XT with at least one drive and DOS version 2 is required for full implementation of course examples. The tuition fee is tax deductible in Canada.

More information may be had by writing Waterloo Distance Education, Inc., Box 279 Weber Street North, Waterloo, Ontario N2J 3H8.

IBM's Sidekick

SCOTT'S VALLEY, CALIFORNIA — Sidekick from *Borland International* is a resident program that can be accessed at any time while running another application. The program hides in free memory and provides a notepad, electronic calendar and datebook, an ASCII table, autodialler and phone directory.

When called upon, Sidekick interrupts whatever program the user is operating and presents its menu in window format. When the user has finished with the temporary windowed application, Sidekick returns to free memory and control is passed again to the previous program at the exact point where it was interrupted.

Borland International is located at 4113 Scotts Valley Drive, Scott's Valley, California 95066 in the United States. A new series of high-speed modems have been introduced by *Paradyne Canada Limited*. The Challenger series is available in 2400, 4800 and 9600 bits per second models, with the latter two offering an optional four port buffered multiplexer...

GIVE AWAY PRICES!!

**Consider
yourself
a winner
if you
buy now**

NOTE

**DON'T
MISS
IT**

We must clear out a large inventory of merchandise before our (Sept. 30, 1984) Fiscal year end. Therefore we urge you to take advantage of this one time sale. Prices are so low that we doubt you can build it cheaper yourself.

Due to the popular demand of our customers, we will now give you a choice between buying goods with a 120-day warranty, or you can buy the same quality goods without warranties as final sale, and SAVE MONEY! If any of the goods without warranty fail, we will be glad to fix them for you, but at your cost.

All goods listed on this page are manufactured using only prime, high quality components and PC Boards, all PC Board products are wave soldered, ultrasonically cleaned, and finished goods are thoroughly tested.

ALL PRICES ON THIS PAGE ARE FINAL SALE PRICES! NO WARRANTY

Should you wish to have a 120 day warranty, all you have to do is ask, and pay a bit more; it is available for almost everything we advertise here.

Integrated

BUSINESS

MANAGEMENT SYSTEM 64 — This integrated business program gives you the computer power once reserved for large corporations. It stores the names of items, prices, item numbers and does all calculations including tax, shipping costs and discounts. It prints invoices and packing slips in addition to short-term and long-term reports. Management System 64 even prints mailing labels from customer files. Know what's selling, whose buying and forget costly, time consuming inventory close downs. **89.95**

Finance

FINANCE CALC 64 — The leader in business and home financial analysis. You can have up to 1440 itemized expenses and print 1085 different financial reports and bar graphs as it stores and compares up to 12 different budgets at once. This powerful program is a must for the rising entrepreneur. **64.95**

File

DATA BASE 64 — A perfect record system for any business or home. It can store up to 1200 records for each file. Each record has a capability of 20 fields of information. The program has multi-level sorting which facilitates quick and easy recalling of information and printing of labels and reports. It even allows you to create personal print formats. Data Base 64 also can be used with popular word processing programs.

3 in 1

FAMILY PAC — Three of the finest home programs available: **64.95**

- **CHECKBOOK SYSTEM 64** — This easy to use program makes the balancing of confusing checkbook finances a breeze. It handles over 1300 transactions of up to 40 expense categories. Checkbook System 64 also prints statements, reports and all types of checks. Pay your bills by computer! Also available as a separate program. **\$39.95**

- **RECIPE KEEPER 64** — This program is a handy kitchen aid that does more than just file. It can print out ingredients and directions, as well as calculate ingredient amounts for different serving sizes. The program comes complete with a mini-word processing section that enables you to type in up to 14 lines of directions. **\$39.95**

- **SPACE MATH 64** — This educational program makes addition, subtraction, multiplication and division learning fun and entertaining for youngsters. Solve math problems, explore the universe, dance to the music and watch the show. **\$39.95**

Music

ENTERTAINMENT

FIRST ANNUAL COMPUTER SONG WRITING CONTEST
FIRST PLACE WINNER WILL RECEIVE \$1000.00

Art

STUDIO 64 — Roll over Beethoven, now anyone can create music as expressive and sophisticated as the most advanced programmers!! With Studio 64, the computer does all the work while you play and enjoy. It is the only music program available that allows you to create music without any programming knowledge. Just play and the computer will instantly write the music on the screen. Enter up to 3 voices and choose from 4 wave forms on any voice. Play your compositions at different speeds and filter settings with synthesized drum rhythms! It will save and recall, add music to your own programs and print lead sheets. Music is only as far away as your C64. Disk/Cass **\$54.95**

GAME DESIGNER 64 — This package contains everything you need to design colorful game characters, backgrounds and entire screens. Animate up to 16 sprites on the background of your choice. Add it to your own program. The limits are your own creativity. Combine it with Studio 64 to create any game imaginable. Power game sub-routine included. Disk/Cass **\$54.95**

See us for Personal, Business, and Educational requirements. Educational Discounts available.

— All programs come in disk unless otherwise indicated. —

WHEN THE DUST SETTLES THE QUALITY REMAINS

LIST!

Most computer users have at least one major project in the works and we have all experienced the odd sensation of coming out of an analytical fog to discover that the sun is just peering over the rooftops and the night has been spent in revisions. It is for this reason that small programs exist. They can't simulate attacks from the Crab Nebula or figure out the exact value of Pi but they're fun, or clever or just diverting. On these pages we present some of the programs submitted by our readers or dreamed up by ourselves... after giving up on the software for the matter transporter.

Readers are invited to submit programs for LIST!. They should be printed out with a reasonably new ribbon... we cannot accept hand written or hand typed software... and of a length that can be dealt with in one printed page or so (or less). We suggest that the author's name and address appear somewhere in the listing. We pay for programs on publication.

Demand Loan Interest by Roger N. Tulk

When you sign the loan agreement at the bank for the computer system of your dreams, the manager's eyes inevitably light up. This program, written in Applesoft BASIC, tells you why.

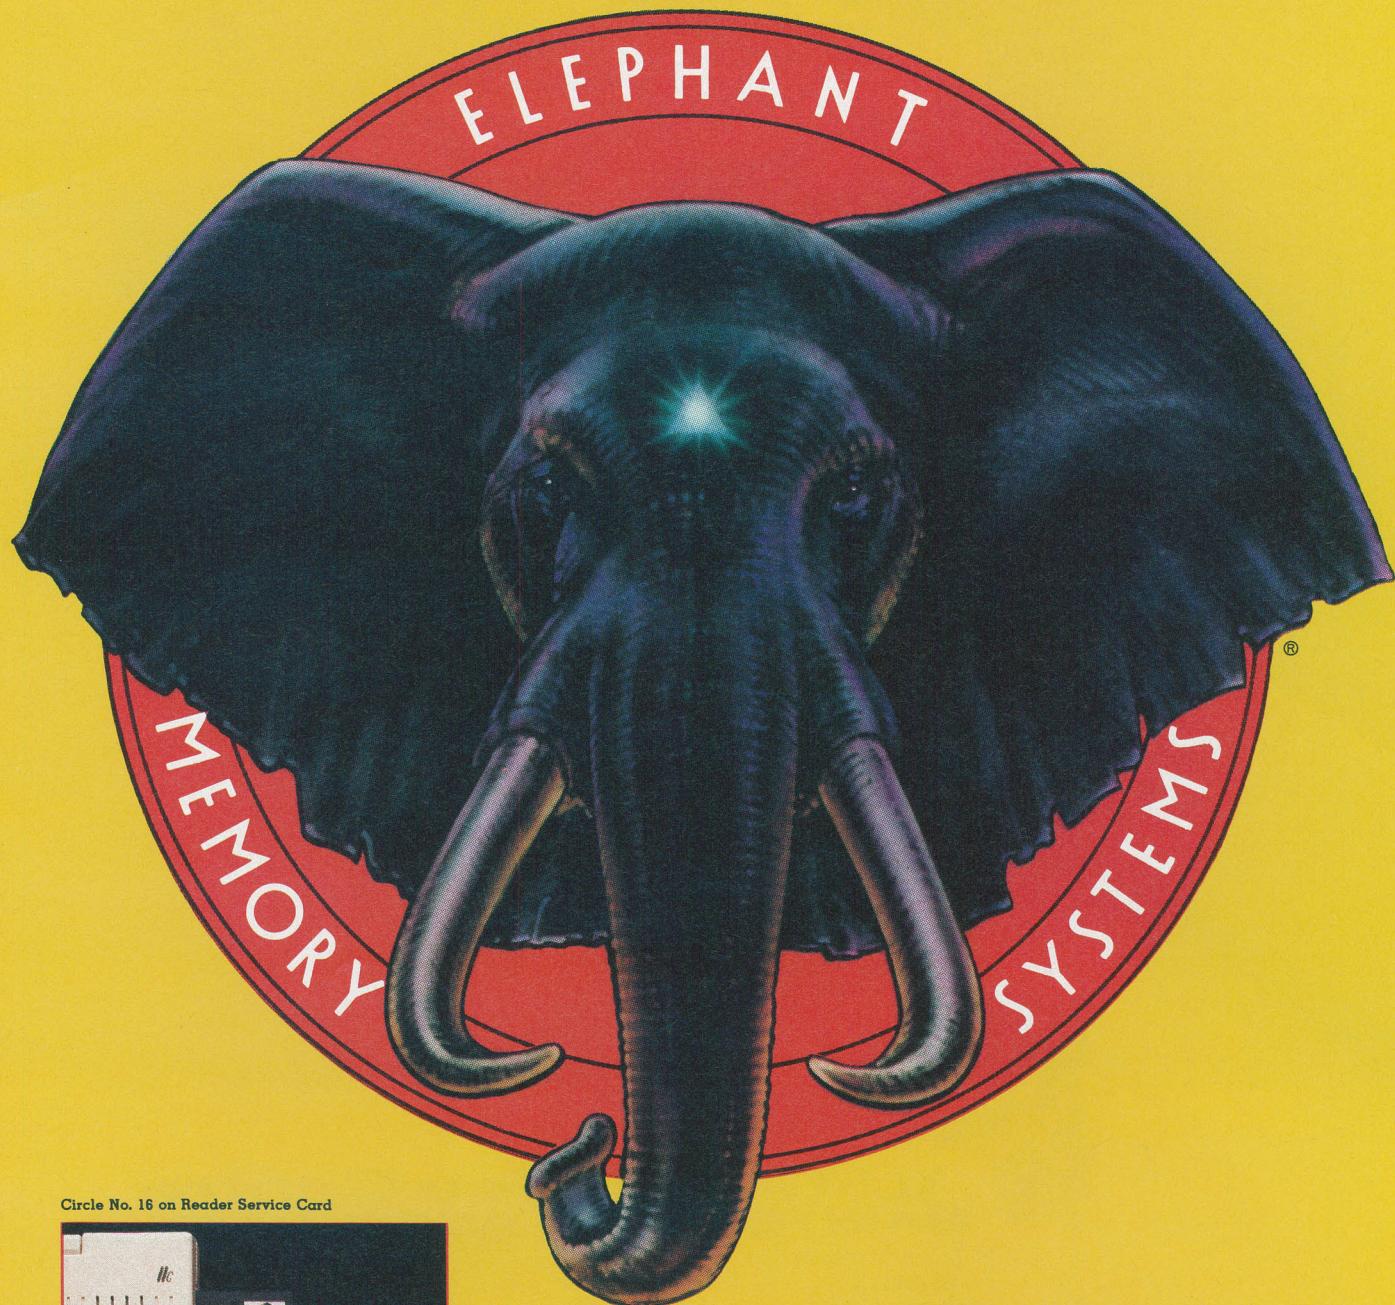

```
1000 REM DEMAND LOAN INTEREST
1100 REM BY ROGER N. TULK
1200 PRINT "THIS PROGRAM CALCULATES INTEREST ON A DEMAND LOAN BY THE SAME METHOD THAT THE BANKS USE."
1300 PRINT : PRINT "AS BOTH PRINCIPAL AND INTEREST RATE FLUCTUATE IN A REVOLVING DEMAND LOAN, YOU MAY CHANGE RATE AND PRINCIPAL AS OFTEN AS YOU WISH DURING A PERIOD. THE"
1400 PRINT "PROGRAM WILL ACCUMULATE THE INTEREST ACCRUED AFTER EACH CHANGE UNTIL YOU REACH THE END OF THE PERIOD UNDER CONSIDERATION."
1500 PRINT : PRINT
1600 CST = 0: TD = 0
1700 INPUT "PRINCIPAL AMOUNT ":"F"
1800 INPUT "INTEREST RATE ":"I"
1900 INPUT "NUMBER OF DAYS AT THIS PRINCIPAL AND INTEREST RATE ":"D"
2000 PRINT : PRINT
2100 IC = (D * P) / (365 / I * 100)
2200 CST = CST + IC
```

```
2300 TD = TD + D
2400 PRINT "DO YOU HAVE A DIFFERENT INTEREST RATE OR PRINCIPAL, AND NUMBER OF DAYS IN THE PERIOD FOR WHICH YOU ARE CALCULATING INTEREST COST? (Y/N)"
2500 PRINT : PRINT
2600 GET A$: IF A$ = "Y" THEN 1700
2700 REM ROUND TO TWO DECIMAL PLACES
2800 NCST = INT ((CST + .005) * 100)
2900 RCST = NCST / 100
3000 PRINT "TOTAL INTEREST COST FOR THE TOTAL DAYS ENTERED IS $":RCST
3100 PRINT : PRINT "TOTAL DAYS IN PERIOD WAS ";TD;". "
```
